Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

## COMMENT

of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA  
On Sep 19, 2002 this sequence version replaced gi:21908223.  
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). As a result, the sequence may extend beyond the ends of the clone and there may be contigs that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

## ----- Genome Center

Center: Baylor College of Medicine

Center code: BCM

Web site: <http://www.hgsc.bcm.tmc.edu/>

Contact: hgsc-help@bcm.tmc.edu

## ----- Project Information

Center project name: GX00

Center clone name: CH230-16F9

## ----- Summary Statistics

Assembly program: Phrap; version 0.990329

Consensus quality: 229731 bases at least Q40

Consensus quality: 232074 bases at least Q30

Consensus quality: 233846 bases at least Q20

Estimated insert size: 258987; sum-of-contigs estimation

Quality coverage: 3x in Q20 bases; sum-of-contigs estimation

## -----

\* NOTE: Estimated insert size may differ from sequence length  
\* (see [http://www.hgsc.bcm.tmc.edu/docs/Genbank\\_draft\\_data.html](http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html))  
\* NOTE: This sequence may represent more than one clone.  
\* NOTE: This is a 'working draft' sequence. It currently  
\* consists of 2 contigs. The true order of the pieces  
\* is not known and their order in this sequence record is  
\* arbitrary. Gaps between the contigs are represented as  
\* runs of N, but the exact sizes of the gaps are unknown.  
\* This record will be updated with the finished sequence  
\* as soon as it is available and the accession number will  
\* be preserved.

\* 1 99258: contig of 99258 bp in length

\* 99259 99358: gap of unknown length

\* 99359 245255: contig of 145897 bp in length.

During sequence assembly data is compared from overlapping clones.  
Where differences are found these are annotated as variations  
together with a note of the overlapping clone name. Note that the  
variation annotation may not be found in the sequence submission  
corresponding to the overlapping clone, as we submit sequences with  
only a small overlap as described above.  
This sequence was finished as follows unless otherwise noted: all  
regions were either double-stranded or sequenced with an alternate  
chemistry or covered by high quality data (i.e., phred quality >  
30); an attempt was made to resolve all sequencing problems, such  
as compressions and repeats; all regions were covered by at least  
one plasmid subclone or more than one M13 subclone; and the  
assembly was confirmed by restriction digest, except on the rare

occasion of the clone being a YAC.  
The following abbreviations are used to associate primary accession  
numbers given in the feature table with their source databases:  
Emi, EMBL; Swi, SWISSPROT; Tr, TREMBL; Wp, WORMPEP; Information  
on the WORMPEP database can be found at  
[http://www.sanger.ac.uk/Projects/C\\_elegans/wormpep](http://www.sanger.ac.uk/Projects/C_elegans/wormpep) Clone-derived  
zebrafish pUC subclones occasionally display inconsistency over the  
length of mononucleotide A/T runs and conserved TA repeats. Where  
this is found the longest good quality representation will be  
submitted.  
Repeat names beginning 'Dr' were identified by the Recon repeat  
discovery system (Zhifeng Bao and Sean Eddy, submitted), and those  
beginning 'drr' were identified by Rick Waterman (Stephen Johnson  
lab, WashU). For further information see

----- Project Information  
Center project name: fcl  
Center clone name: 138F17

The sequence data in this record represents an 'enhanced' version of a Phase 2 submission. Specifically, the indicated order and orientation of each sequence contig has been established using one or more of the following: read-pair data from individual subclones, overlaps with neighboring clones, alignment with available reference sequence (e.g., human), and/or confirmation by PCR testing. In addition, the sequence assembly is based on at least 8X average coverage in Q20 bases and has been reviewed to rule out gross misassemblies, the low-quality ends of sequence contigs have been trimmed away, and each base is associated with a Phrap-derived quality score.

assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with 'N's to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

-----
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone or more than one M13 subclone; and the
assembly was confirmed by restriction digest, except on the rare
occasion of the clone being a YAC.
The following abbreviations are used to associate primary accession
numbers given in the feature table with their source databases:
Em: EMBL; Sw: SWISSPROT; Tr: TrEMBL; Wp: WORMPEP; Information
on the WORMPEP database can be found at
http://www.sanger.ac.uk/Projects/C_elegans/wormpep
Zebrafish pUC subclones occasionally display inconsistency over the
length of mononucleotide A/T runs and conserved TA repeats. Where
this is found the longest good quality representation will be
submitted.
Repeat names beginning 'Dr' were identified by the Recon repeat
discovery system (Zhifeng Bao and Sean Eddy, submitted), and those
beginning 'drr' were identified by Rick Waterman (Stephen Johnson
lab, WashU). For further information see
http://www.sanger.ac.uk/Projects/D_rerio/fishmask.shtml CH211-11319
is from a CHORI-211 BAC library

-----
During sequence assembly data is compared from overlapping clones.
Where differences are found these are annotated as variations
together with a note of the overlapping clone name. Note that the
variation annotation may not be found in the sequence submission
corresponding to the overlapping clone, as we submit sequences with
only a small overlap as described above.
This sequence was finished as follows unless otherwise noted: all
regions were either double-stranded or sequenced with an alternate
chemistry or covered by high quality data (i.e., phred quality >=
30); an attempt was made to resolve all sequencing problems, such
as compressions and repeats; all regions were covered by at least
one plasmid subclone or more than one M13 subclone; and the
assembly was confirmed by association digest. The following
abbreviations are used to associate primary accession numbers given
in the feature table with their source databases: Em:, EMBL; SW:,
SWISSPROT; Tr:, TREMBL; Wp:, WORMPEP; Information on the WORMPEP
database can be found at
http://www.sanger.ac.uk/Projects/C_elegans/wormpep
from the RPI21-Mouse PAC Library

Baylor Plaza, Houston, TX 77030, USA  
On Jun 28, 2005 this sequence version replaced gi:56606215.  
The sequence in this assembly is a combination of BAC based reads  
and whole genome shotgun sequencing reads assembled using Atlas  
(<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described  
in the feature table below represents a scaffold in the Atlas  
assembly (a 'contig-scaffold'). Within each contig-scaffold,  
individual sequence contigs are ordered and oriented, and separated  
by sized gaps filled with Ns to the estimated size. The sequence  
may extend beyond the ends of the clone and there may be sequence  
contigs within a contig-scaffold that consist entirely of whole  
genome shotgun sequence reads. Both end sequences and whole genome  
shotgun sequence only contigs will be indicated in the feature  
table.

## RESULT 49

BX322665

## DEFINITION

BX322665 192437 bp DNA linear VRT 17-APR-2005  
Zebrafish DNA sequence from clone DKEY-183N20 in linkage group 20  
Contains two novel genes, the cyp2j2a gene for cytochrome P450  
family 2 subfamily J polypeptide 2 A, the cyp2j2b gene for  
cytochrome P450, family 2 subfamily J polypeptide 2 B, the cyp2v2  
gene for cytochrome P450 family 2 subfamily V polypeptide 2, five  
genes for novel proteins similar to cytochrome P450 family 2  
subfamily J, the gene for a novel protein similar to cytochrome  
P450 family 2 subfamily J (zgc:55731), the cyp2j1a gene for  
cytochrome P450 subfamily IIU (arachidonic acid epoxidase)  
polypeptide A, the gene for a novel protein similar to vertebrate  
hook homolog 1 (Drosophila) (HOOK1), the gene for a novel zinc  
finger protein, the gene for a novel protein similar to vertebrate  
phosphoribosylformylglycinamide synthase (PGR amidotransferase)  
(PPAS), the gene for a novel protein similar to vertebrate  
mitochondrial ribosomal protein L19 (MRPL19) and a novel  
pseudogene, complete sequence.

-----

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em., EMBL; Sw., SWISSPROT; Tr., TREMBL; Wp., WormBEP; Information on the WormBEP database can be found at [http://www.sanger.ac.uk/Projects/C\\_elegans/wormBEP](http://www.sanger.ac.uk/Projects/C_elegans/wormBEP) DKEY-183N20 is from a Zebrafish BAC library

VECTOR: pindigobAC-5  
Clone-derived Zebrafish pUC subclones occasionally display inconsistency over the length of mononucleotide A/T runs and conserved TA repeats. Where this is found the longest good quality representation will be submitted.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

Any regions longer than 1kb tagged as misc-feature 'unseq' are part of a tandem repeat of more than 10kb in length where it has not been possible to anchor the base differences between repeat copies. The region has been built up based on the repeat element to match the total size of repeat indicated by restriction digest,

but repeat copies may not be in the correct order and the usual  
finishing criteria may not apply.

During sequence assembly data is compared from overlapping clones.

```

Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above. This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em; EMBL; Sw; SWISSPROT; Tr; TREMBL; Wp; WORMPEP; Information on the WORMPEP database can be found at [http://www.sanger.ac.uk/Projects/C\\_elegans/wormpep](http://www.sanger.ac.uk/Projects/C_elegans/wormpep) Clone-derived zebrafish pUC subclones occasionally display inconsistency over the length of mononucleotide A/T runs and conserved TA repeats, where this is found the longest good quality representation will be submitted.

Repeat names beginning 'Dr' were identified by the Recon repeat discovery system (Zhirong Bao and Sean Eddy, submitted), and those beginning 'drr' were identified by Rick Waterman (Stephen Johnson lab, WashU). For further information see [http://www.sanger.ac.uk/Projects/D\\_rerio/fishmark.shtml](http://www.sanger.ac.uk/Projects/D_rerio/fishmark.shtml) DKEXP-79F12 is from a Zebrafish BAC library

VECTOR: pindigobac-5.

3 (bases 1 to 197981)  
Rat Genome Sequencing Consortium.  
Submitted (15-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA  
On Nov 15, 2002 this sequence version replaced gi:23194925.  
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least

one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases: Em: EMBL; Sw: SWISSPROT; Tr: TREMBL; Wp: WORMPEP; Information on the WORMPEP database can be found at [http://www.sanger.ac.uk/Projects/C\\_elegans/wormpep](http://www.sanger.ac.uk/Projects/C_elegans/wormpep)

beginning 'Dr' were identified by the Recon repeat discovery system (Zhifeng Bao and Sean Eddy, submitted), and those beginning 'dir' were identified by Rick Waterman (Stephen Johnson lab, WashU). For further information see [http://www/Projects/D\\_rerio/fishmask.shtml](http://www/Projects/D_rerio/fishmask.shtml)

CH211-196D9 is from a CHORI-211 BAC library

VECTOR: pPRABAC2.1.

## NOTICE:

This sequence was finished as follows unless otherwise noted: all regions were double stranded, sequenced with an alternate chemistry, or covered by high quality data (i.e. phred quality >=30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone, fosmid clone or direct clone walk sequence. Sequence from the Mouse Genome Sequencing Consortium whole genome shotgun may have been used to obtain the consensus sequence. The assembly was confirmed by restriction digest. This finishing standard has slightly changed from the previous Human standard. Specifically, standards for regions of low sequence complexity (such as dinucleotide repeats and small unit tandem repeats) have been relaxed. These regions are very prevalent in the mouse genome, and the return on extended finishing efforts is minimal.

If a sequence meets the criteria of the above statement, it needs no comments or tags. If the criteria are not met, such as ambiguous bases, then the region is duly annotated.

## MAPPING INFORMATION:

Mapping information for this clone was provided by Dr. Wes Warren, Department of Genetics, Washington University, St. Louis MO. For additional information about the map position of this sequence, see <http://genome.wustl.edu>

## SOURCE INFORMATION:

The BAC library has been constructed by Kazuhiro Oseegawa and Minako Tatenio in the laboratory of Pieter de Jong (<http://www.chori.org>) from female C57BL/6J mouse kidney and/or brain genomic DNA. The clone and detailed information can be obtained from Research Genetics, Inc. (<http://www.resgen.com>) or Pieter de Jong and coworkers at <http://www.chori.org>

This sequence is the entire insert of the clone.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all regions were either double-stranded or sequenced with an alternate chemistry or covered by high quality data (i.e., phred quality >= 30); an attempt was made to resolve all sequencing problems, such as compressions and repeats; all regions were covered by at least one plasmid subclone or more than one M13 subclone; and the assembly was confirmed by restriction digest, except on the rare occasion of the clone being a YAC.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

EMBL, SW: SWISSPROT, Tr: TREMBL, Wp: WORMPEP, Information on the WORMPEP database can be found at [http://www.sanger.ac.uk/Projects/C\\_elegans/wormpep](http://www.sanger.ac.uk/Projects/C_elegans/wormpep) Repeat names beginning 'Dr' were identified by the Recon repeat discovery system (Chirong Bao and Sean Eddy, submitted), and those beginning 'dir' were identified by Rick Waterman (Stephen Johnson lab, WashU). For further information see [http://www/projects/D\\_retro/fishmask.shtml](http://www/projects/D_retro/fishmask.shtml) DKEY-14K1 is from a Zebrafish BAC library

Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA  
3 (bases 1 to 222869)  
Rat Genome Sequencing Consortium.  
Direct Submission  
Submitted (19-NOV-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA  
On Nov 19, 2002 this sequence version replaced gi:23269985.  
The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/atlas/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

 Consensus quality: 217080 bases at least Q20  
 Estimated insert size: 223267; sum-of-coverage estimation  
 Quality coverage: 6x in Q20 bases; sum-of-coverage estimation  
 -----  
 \* NOTE: Estimated insert size may differ from sequence length  
 \* (see [http://www.hgsc.bcm.tmc.edu/docs/Genbank\\_draft\\_data.html](http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html)).  
 \* NOTE: This is a 'working draft' sequence. It currently  
 \* consists of 1 contigs. Gaps between the contigs  
 \* are represented as runs of N. The order of the pieces  
 \* is believed to be correct as given, however the sizes  
 \* of the gaps between them are based on estimates that have  
 \* provided by the submittor.  
 \* This sequence will be replaced  
 \* by the finished sequence as soon as it is available and  
 \* the accession number will be preserved.

 Direct Submission  
 Submitted (01-JUL-2005) Human Genome Sequencing Center, Department  
 of Molecular and Human Genetics, Baylor College of Medicine, One  
 Baylor Plaza, Houston, TX 77030, USA  
 On Jun 28, 2005 this sequence version replaced gi:51315443.  
 The sequence in this assembly is a combination of BAC based reads  
 and whole genome shotgun sequencing reads assembled using Atlas  
 (<http://www.hgsc.bcm.tmc.edu/projects/ret/>). Each contig described  
 in the feature table below represents a scaffold in the Atlas  
 assembly (a contig-scaffold). Within each contig-scaffold,  
 individual sequence contigs are ordered and oriented, and separated  
 by sized gaps filled with Ns to the estimated size. The sequence  
 may extend beyond the ends of the clone and there may be sequence  
 contigs within a contig-scaffold that consist entirely of whole  
 genome shotgun sequence reads. Both end sequences and whole genome  
 shotgun sequence only contigs will be indicated in the feature  
 table.

## COMMENT

On Sep 18, 2002 this sequence version replaced gi:21745859. The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). As a result, the sequence may extend beyond the ends of the clone and there may be contigs that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

Center: Baylor College of Medicine  
Center code: BCM

Web site: <http://www.hgsc.bcm.tmc.edu/>  
Contact: hgsc-help@bcm.tmc.edu

## ----- Project Information

Center project name: GIN  
Center clone name: CH230-223G12

## ----- Summary Statistics

Assembly program: Phrap; version 0.990329  
Consensus quality: 209112 bases at least Q40  
Consensus quality: 212400 bases at least Q30  
Consensus quality: 214539 bases at least Q20  
Estimated insert size: 258937; sum-of-contigs estimation  
Quality coverage: 3x in Q20 bases; sum-of-contigs estimation

NOTE: Estimated insert size may differ from sequence length  
(see [http://www.hgsc.bcm.tmc.edu/docs/Genbank\\_draft\\_data.html](http://www.hgsc.bcm.tmc.edu/docs/Genbank_draft_data.html))

NOTE: This sequence may represent more than one clone.

NOTE: This is a 'working draft' sequence. It currently consists of 4 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as

runs of N, but the exact sizes of the gaps are unknown.

This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

1 204361: contig of 204361 bp in length  
204362 204461: gap of unknown length  
204462 204817: contig of 39356 bp in length  
204818 243918: gap of unknown length  
243918 245571: contig of 1654 bp in length  
245571 245671: gap of unknown length  
245671 247670: contig of 1999 bp in length.

 Rat Genome Sequencing Consortium.  
 DIRECT SUBMISSION  
 Submitted (21-SEP-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA

COMMENT On Sep 21, 2002 this sequence version replaced gi:21738285. The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). As a result, the sequence may extend beyond the ends of the clone and there may be contigs that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

 TITLE Submitted (01-JUN-2005) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Baylor Plaza, Houston, TX 77030, USA  
 JOURNAL On Jun 26, 2005 this sequence version replaced gi:58038068.  
 COMMENT The sequence in this assembly is a combination of BAC based reads

and whole genome shotgun sequencing reads assembled using Atlas (<http://www.hgsc.bcm.tmc.edu/projects/rat/>). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

# COMMENT

The sequence in this assembly is a combination of BAC based reads and whole genome shotgun sequencing reads assembled using Atlas (http://www.hgsc.bcm.tmc.edu/projects/rat/). Each contig described in the feature table below represents a scaffold in the Atlas assembly (a 'contig-scaffold'). Within each contig-scaffold, individual sequence contigs are ordered and oriented, and separated by sized gaps filled with Ns to the estimated size. The sequence may extend beyond the ends of the clone and there may be sequence contigs within a contig-scaffold that consist entirely of whole genome shotgun sequence reads. Both end sequences and whole genome shotgun sequence only contigs will be indicated in the feature table.

\* NOTE: This is a 'working draft' sequence. It currently  
\* consists of 10 contigs. The true order of the pieces  
\* is not known and their order in this sequence record is  
\* arbitrary. Gaps between the contigs are represented as  
\* runs of N, but the exact sizes of the gaps are unknown.  
\* This record will be updated with the finished sequence  
\* as soon as it is available and the accession number will  
\* be preserved.

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

 XX  
 XX New bacteria capable of oxidizing ammonia to nitrite, for preventing or  
 PT alleviating the accumulation of ammonia in fresh water aquaria, seawater  
 PT aquaria and waste water.  
 PT  
 XX  
 PS Claim 26; Page 53; 62pp; English.  
 CC  
 XX The invention relates to 4 novel types of ammonia-oxidizing bacteria  
 CC (AOB) found in freshwater aquaria. The bacteria are able to oxidise  
 CC ammonia to nitrite and are members of the ammonia-oxidising bacteria  
 CC family of the beta subdivision of Proteobacteria. The 4 types of bacteria  
 CC can be distinguished on the basis of their 16S rRNA (ribosomal RNA) gene  
 CC sequences (ABA02416-ABA02419), and are classified as AOB type A (e.g.,  
 CC R7clone140), type A1 (e.g., R7clone187), type B (e.g., R3clone5) and type  
 CC C (e.g., R3clone47). The invention also encompasses isolated 16S rRNA  
 CC oligonucleotide probes and primers for the detection of these bacteria,  
 CC and compositions comprising the bacteria. The bacteria of the invention  
 CC are useful in biological filters for reducing ammonia accumulation in  
 CC both freshwater and seawater aquaria. They may also be used in waste  
 CC water treatment and in bioremediation processes to reduce the level of  
 CC pollution caused by ammonia. The present sequence represents a  
 CC specifically claimed probe for the detection of the 16S rRNA gene  
 CC sequences of the type A and A1 ammonia-oxidising bacteria (ABA02416-  
 CC ABA02417). (Updated on 29-AUG-2003 to standardise OS field)

 PS Claim 2; Page 5; 62pp; English.

CC The invention relates to 4 novel types of ammonia-oxidising bacteria  
CC (AOB) found in freshwater aquaria. The bacteria are able to oxidise  
CC ammonia to nitrite and are members of the ammonia-oxidising bacteria  
CC family of the beta subdivision of Proteobacteria. The 4 types of bacteria  
CC can be distinguished on the basis of their 16S rRNA (ribosomal RNA) gene  
CC sequences (ABA02416-ABA02419), and are classified as AOB type A (e.g.,  
CC R7clone140), type A1 (e.g., R7clone187), type B (e.g., R3clone5) and type  
CC C (e.g., R3clone47). The invention also encompasses isolated 16S rRNA  
CC gene sequences of the ammonia-oxidising bacteria of the invention,  
CC oligonucleotide probes and primers for the detection of these bacteria,  
CC and compositions comprising the bacteria. The bacteria of the invention  
CC are useful in biological filters for reducing ammonia accumulation in  
CC both freshwater and seawater aquaria. They may also be used in waste  
CC water treatment and in bioremediation processes to reduce the level of  
CC pollution caused by ammonia. The present sequence represents R7clone140,  
CC a 16S rRNA gene sequence from the type A ammonia-oxidising bacterium of  
CC the invention. (Updated on 29-AUG-2003 to standardise OS field)

XX Determining the ethnic origin of a male by obtaining a nucleic acid

PT sample from the male and identifying at least two polymorphic markers in

PT the nucleic acid sample indicative of the ethnic origin of the male.

XX Claim 24; Page 39; 74pp; English.

XX The invention describes a method of determining the ethnic origin of a

CC male comprising obtaining a nucleic acid sample from the male, and

CC identifying at least two polymorphic markers in the nucleic acid sample

CC indicative of the ethnic origin of the male, using at least one primer

CC pair from the primer pairs given in the specification. Also described is

CC a method of: identifying polymorphic sites in a nucleic acid; a kit for

CC determining the ethnic origin of an individual; determining the ethnic

CC origin of a human male individual; an isolated nucleic acid segment of a

CC human Y chromosome comprising at least 10 contiguous bases including at

CC least one of the polymorphic sites given in the specification; nucleic

CC acid primer pairs for amplifying polymorphic regions of the Y chromosome

CC given in the specification; and determining the paternity of a human male

CC individual. The method is useful for determining the ethnic origin of a

CC male, for paternity testing, for forensic studies or for diagnosis. This

CC sequence represents a primer used to detect polymorphisms in the non-

CC recombining region of the human Y chromosome (NRY).

 XX  
 PS Claim 14; SEQ ID NO 15346; 1766pp; English.

CC The invention relates to an isolated nucleic acid comprising any one of  
 CC the 6213 antisense sequences given in the specification where expression  
 CC of the nucleic acid inhibits proliferation of a cell. Also included are:  
 CC (1) a vector comprising a promoter operably linked to the nucleic acid  
 CC encoding a polypeptide whose expression is inhibited by the antisense  
 CC nucleic acid; (2) a host cell containing the vector; (3) an isolated  
 CC polypeptide or its fragment whose expression is inhibited by the  
 CC antisense nucleic acid; (4) an antibody capable of specifically binding  
 CC the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular  
 CC proliferation or the activity of a gene in an operon required for  
 CC proliferation; (7) identifying a compound that influences the activity of  
 CC the gene product or that has an activity against a biological pathway  
 CC required for proliferation, or that inhibits cellular proliferation; (8)  
 CC identifying a gene required for cellular proliferation or the biological  
 CC pathway in which a proliferation-required gene or its gene product lies  
 CC or a gene on which the test compound that inhibits proliferation of an  
 CC organism acts; (9) manufacturing an antibiotic; (10) profiling a  
 CC compound's activity; (11) a culture comprising strains in which the gene  
 CC product is overexpressed or underexpressed; (12) determining the extent  
 CC to which each of the strains is present in a culture or collection of  
 CC strains; or (13) identifying the target of a compound that inhibits the  
 CC proliferation of an organism. The antisense nucleic acids are useful for  
 CC identifying proteins or screening for homologous nucleic acids required  
 CC for cellular proliferation to isolate candidate molecules for rational  
 CC drug discovery programs, or for screening homologous nucleic acids  
 CC required for proliferation in cells other than *S. aureus*, *S. typhimurium*,  
 CC *K. pneumoniae* or *P. aeruginosa*. The present sequence is one of the target  
 CC prokaryotic essential genes. Note: The sequence data for this patent did  
 CC not form part of the printed specification, but was obtained in  
 CC electronic format directly from WIPO at  
 CC ftp.wipo.int/pub/published\_pct\_sequences

PT Single copy genomic hybridization probes for detecting specific nucleic  
PT acid sequences in sample by in situ hybridization useful for detection of  
PT acquired or inherited genetic diseases.

XX Example 1; SEQ ID NO 179; 30pp; English.

XX The invention relates to a nucleic acid hybridization probe comprising a  
XX labelled, single copy nucleic acid of at least 50 nucleotides, which  
XX will hybridize to a deduced single copy sequence interval in target  
XX nucleic acid (TNA) of known sequence. The single copy sequence is deduced  
XX by comparing the target nucleic acid (e.g. a disease causing gene) with a  
XX collection of high and low complexity repeat sequences as found in the  
XX genome of the organism from containing the target nucleic acid. The probe  
XX is generated by PCR on the target sequence. The probe is essentially free  
XX of blocking nucleic acid sequences which will hybridize to repeat  
XX sequences within the genome of which the TNA is a part, and is labelled  
XX with a label selected from fluorochrome-responsive labels, fluorochromes,  
XX calorimetric chemical, conjugated proteins, antibodies, antigens and  
XX their mixtures. The probe is useful in a hybridization method, where the  
XX hybridization method is from in situ hybridization, Southern blot, and  
XX other methods in which nucleic acid is immobilized, where the method  
XX further comprises selecting a single copy nucleic acid which will  
XX hybridize to a duplication or triplication sequence domain. The probe is useful  
XX for determining the existence of previously unknown repeat sequence  
XX families in a genome. The method comprises reacting a labelled probe with  
XX the genome, causing the probe to hybridize and ascertaining if the probe  
XX hybridizes to the genome at more than three preferably ten different  
XX locations as a determination of new repeat sequence family, where the  
XX determining step comprises selecting the single copy sequence from a  
XX duplication or triplication sequence domain. The probe is useful for  
XX determining a chromosome breakpoint and is useful in the fields for  
XX cytogenetics and molecular genetics for determining the presence of  
XX specific nucleic acid sequences in a sample of eukaryotic origin, e.g.  
XX the probes may be used to analyse specific chromosomal locations by in  
XX situ hybridization as a detection of acquired or inherited genetic  
XX diseases especially for detection of genetic or neoplastic disorders.  
XX Unlike prior art techniques, the probe permits more precise chromosomal  
XX breakpoint determinations by in situ hybridization. The genomic sequence  
XX comprising the human HIRA gene (histone cell cycle regulation defective,  
XX S. cerevisiae, homologue A) was analysed for single copy sequence  
XX intervals for use as probes of the invention. HIRA is located on  
XX chromosome 22 as a duplicate, deletions of 1 copy lead to DiGeorge and  
XX Velo-Cardio-facial syndromes. The present sequence is a high complexity  
XX repeat found within the human genome used to analyse the HIRA gene for  
XX repeat regions. Note: The sequence data for this patent did not form part  
XX of the printed specification, but was obtained in electronic format  
XX directly from USPTO at seqdata.uspto.gov/sequence.html?docID=20030224356.

XX Single copy genomic hybridization probes for detecting specific nucleic  
XX acid sequences in sample by in situ hybridization useful for detection of  
XX acquired or inherited genetic diseases.

XX Example 1; SEQ ID NO 179; 67pp; English.

XX The invention describes a nucleic acid hybridization probe (I) comprising  
XX a labeled, single copy nucleic acid of at least 50 nucleotides, which  
XX will hybridize to a deduced single copy sequence interval in target  
XX nucleic acid (TNA) of known sequence. (I) is useful in a hybridization  
XX method which comprises preparing a reaction mixture comprising TNA and  
XX (I) which hybridizes to TNA, and causing (I) to hybridize to TNA, where  
XX the hybridization method is from in situ hybridization, Southern blot,  
XX and other methods in which nucleic acid is immobilized, where the method  
XX further comprises selecting a single copy nucleic acid which will  
XX hybridize to a duplication or triplication sequence domain. (I) is useful for:  
XX determining the existence of previously unknown repeat sequence families  
XX in a genome; determining a chromosome breakpoint and in the fields of  
XX cytogenetics and molecular genetics for determining the presence of  
XX specific nucleic acid sequences in a sample of eukaryotic origin, e.g.  
XX the probes may be used to analyse specific chromosomal locations by in  
XX situ hybridization as a detection of acquired or inherited genetic  
XX diseases especially for detection of genetic or neoplastic disorders.  
XX Unlike prior art techniques, (I) permits more precise chromosomal  
XX breakpoint determinations by in situ hybridization. Hybridization  
XX techniques utilizing (I), have made it possible to obtain reliable,  
XX easily detectable signals with relatively small probes. A readily  
XX detectable signal was obtained with a probe on the order of 2 kb in  
XX length, using fluorescent in situ hybridization (FISH) technology. This  
XX sensitivity of (I) is improved compared to the prior art, because the  
XX probes of (I) are homogeneous single copy sequences. However, smaller  
XX amplified segments, each comprising non-repetitive sequences, may also be  
XX used in combination as probes to achieve adequate signals for in situ  
XX hybridization. Complex single copy probes that hybridize to duplicated or  
XX triplicated targets can also increase hybridization signals. This  
XX sequence represents a human HIRA genomic sequence that shows homology to  
XX a known high-complexity repeat sequence family of the human genome and is  
XX used in the creation of an HIRA gene probe.

PS
XX
XX The invention relates to an isolated nucleic acid detection reagent
CC capable of detecting 1000 or more genes from Drosophila. The invention is
CC useful in developmental biology and in elucidating cell signalling and
CC cell-cell interactions in higher eukaryotes for the development of
CC insecticides, therapeutics and pharmaceutical drugs. The invention
CC discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA
CC sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-
CC ABB72072). The sequence data for this patent did not form part of the
CC printed specification, but was obtained in electronic format directly
CC from WIPO at ftp.wipo.int/pub/published_pct_sequences

PT comprises a nucleotide sequence.
XX
XX Claim 1; SEQ ID NO 1738; opp; English.
PS
XX
XX The present invention relates to novel DNA and protein sequences which
CC are associated with carcinomas. The sequences are useful for: (i) for
CC screening drug candidates; (ii) for screening of bioactive agent capable
CC of binding to Carcinoma Associated Protein (CAP); (iii) for screening of
CC a bioactive agent capable of modulating the activity of CAP; (iv) for
CC evaluating the effect of a candidate carcinoma drug; (v) for diagnosing
CC carcinoma; (vi) for inhibiting the activity of CAP; (vii) for treating
CC carcinoma; (viii) for neutralizing the effect of CAP; (ix) as a biochip;
CC (x) for diagnosing carcinoma or a propensity to carcinoma; and (xi) for
CC determining Carcinoma Associated (CA) gene copy number. In addition, the
CC CA genes are useful as DNA vaccines and the CAP are useful as markers of
CC carcinoma including lymphoma. The present sequence is one such CA coding
CC sequence. Note: This patent is an equivalent to basic patent
CC US2002182586A1, for which no sequence data was published

XX PS Disclosure; SEQ ID NO 167; 182pp; English.
XX CC
XX CC The invention relates to cancer-associated proteins (CAP) and the cancer-
XX CC associated (CA) nucleic acids encoding them. The invention also relates
XX CC to a method for treating cancers involving administering to a patient an
XX CC inhibitor of CAP, and a method of screening for anticancer activity in a
XX CC potential drug involving providing a cell that expresses a CA gene,
XX CC contacting a tissue sample derived from a cancer cell with an anticancer
XX CC drug candidate and monitoring the effect of the anticancer drug candidate
XX CC on expression of the CA gene. The CAP proteins are useful for detecting
XX CC cancer associated with expression of a CAP protein in a test cell sample
XX CC and for screening for a bioactive agent capable of modulating the
XX CC activity of a CAP protein. The CA nucleic acids are useful for diagnosing
XX CC cancer, involving determining the expression of a CA nucleic acid in a
XX CC tissue. This sequence represents a murine CA gene of the invention. Note:
XX CC The sequence data for this patent did not form part of the printed
XX CC specification, but was obtained in electronic format directly from WIPO
XX CC at ftp.wipo.int/pub/published_pct_sequences

XX  
CC The invention relates to an isolated polynucleotide comprising any one of  
CC 38043 cDNA sequences, appearing as ACH12789-ACH50831, whose sequence was  
CC determined by the technique of SBH (sequencing by hybridisation). Also  
CC included is a purified polypeptide comprising a sequence corresponding to  
CC a reading frame of the novel polynucleotide. The nucleic acid sequences  
CC are useful in diagnostics as expressed sequence tags (EST) for  
CC identifying expressed genes or for physical mapping of the human genome,  
CC in forensics, in assessing biodiversity, or in identifying mutations  
CC responsible for genetic disorders and other traits. The nucleotide  
CC sequences are also useful as hybridisation probes, as oligomers for PCR,  
CC for chromosome and gene mapping, in the recombinant production of  
CC protein, or in generating antisense DNA or RNA. The purified polypeptide  
CC is useful for generating antibodies specific for it. The present sequence  
CC is one of the 38043 isolated cDNA/EST sequences. Note: The sequence data  
CC for this patent did not form part of the printed specification, but was

CC This invention relates to novel proteins having vascularisation activity.  
CC Specifically, it refers to proteins having an activity of promoting the  
CC expression of vascular endothelial growth factor (VEGF) and/or the VEGF  
CC receptor. VEGF is a representative growth factor involved in normal  
CC vascularisation in growing tissues, for example for fetal growth, tissue  
CC repair and for the menstrual cycle and pregnancy. The present invention  
CC describes these purified proteins, vectors and appropriate antibodies, as  
CC well as a screening assay for identifying substances capable of  
CC inhibiting or promoting VEGF (and VEGF receptor) expression. Furthermore,  
CC it refers to compositions useful for the diagnosis, treatment and  
CC prevention of diseases associated with abnormal VEGF/ VEGF receptor  
CC expression, such as tumor metastasis, psoriasis, chronic rheumatoid  
CC arthritis, diabetic retinopathy, angiodioma, macular degeneration,  
CC angina pectoris, cerebral infarction, vascular dementia or Burger's  
CC disease. Accordingly, they exhibit antiinflammatory, cytostatic,  
CC antiarthritic, antiproliferative, antiarteriosclerotic, cardiant, vasotropic  
CC and neuroprotective activities. This polynucleotide sequence is a human  
CC cDNA that encodes a protein with VEGF promoting activity of the  
CC invention.

CC receptor. VEGF is a representative growth factor involved in normal  
CC vascularisation in growing tissues, for example for fetal growth, tissue  
CC repair and for the menstrual cycle and pregnancy. The present invention  
CC describes these purified proteins, vectors and appropriate antibodies, as  
CC well as a screening assay for identifying substances capable of  
CC inhibiting or promoting VEGF (and VEGF receptor) expression. Furthermore,  
CC it refers to compositions useful for the diagnosis, treatment and  
CC prevention of diseases associated with abnormal VEGF/VEGF receptor  
CC expression, such as tumor metastasis, psoriasis, chronic rheumatoid  
CC arthritis, diabetic retinopathy, angiodysplasia, macular degeneration,  
CC angina pectoris, cerebral infarction, vascular dementia or Buerger's  
CC disease. Accordingly, they exhibit antiinflammatory, cytosolic,  
CC antiphospholipid, antiphospholipid, antiarteriosclerotic, cardiac, vasotropic  
CC and neuroprotective activities. This polynucleotide sequence is a human  
CC cDNA that encodes a protein with VEGF promoting activity of the  
CC invention.

XX  
PS Claim 1; SEQ ID NO 4050; 7273bp; English.  
XX  
CC The invention relates to human tumour-associated antigenic target (TAT)  
CC polypeptides, and their related nucleic acids. The TAT polypeptides are  
CC overexpressed in cancer tissues compared to normal tissues, and may thus  
CC serve as effective targets for the diagnosis and treatment of cancer in  
CC mammals. The invention also relates to nucleic acid and polypeptide  
CC sequences at least 80% identical to the TAT nucleic acids and  
CC polypeptides; expression vectors and host cells comprising a TAT nucleic  
CC acid; an antibody specific for a TAT polypeptide; a peptide or organic  
CC molecule which binds to a TAT polypeptide; fusion proteins comprising a  
CC TAT polypeptide; and methods and compositions for the treatment or  
CC diagnosis of cancer in mammals. TAT polypeptides, nucleic acids,  
CC antibodies, antagonists, binding molecules and compositions are useful  
CC for diagnosing or treating a cell proliferative disorder associated with  
CC increased TAT expression, particularly cancers such as breast cancer,  
CC colorectal cancer, lung cancer, ovarian cancer, liver cancer, bladder  
CC cancer, pancreatic cancer, cervical cancer, cancers of the central  
CC nervous system, melanoma and leukemia. TAT nucleic acids may further be  
CC used as hybridisation probes, in chromosome and gene mapping, in  
CC chromosome identification and in gene therapy. The present sequence  
CC represents a TAT nucleic acid of the invention

PT cancer.  
XX  
XX Claim 1; SEQ ID NO 298; 1185bp; English.  
XX  
XX The invention relates to 971 novel human cDNA sequences (ADC29919-  
CC ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The  
CC invention also relates to nucleic acid sequences over 9% identical with  
CC the novel human cDNAs. The invention additionally encompasses expression  
CC vectors and host cells comprising a nucleic acid of the invention; the  
CC recombinant production of a polypeptide of the invention; an antibody  
CC against a polypeptide of the invention; a method of detecting  
CC polynucleotides or polypeptides of the invention; and methods of  
CC identifying a compound which binds to a polypeptide of the invention. The  
CC invention further discloses methods of preventing, treating or  
CC ameliorating a medical condition; kits comprising polynucleotide probes  
CC and/or monoclonal antibodies for carrying out the methods of the  
CC invention; methods for the identification of compounds that modulate the  
CC expression or activity of the polynucleotide and/or polypeptide; and 767  
CC contig sequences corresponding to the cDNA sequences of the invention  
CC (ADC1861-ADC32627) and the polypeptides encoded by the contigs (ADC32628  
CC -ADC33394). The nucleic acids and polypeptides of the invention are  
CC useful in diagnostics, drug screening, forensics, gene mapping, in the  
CC identification of mutations responsible for genetic disorders or other  
CC traits, for assessing biodiversity, and in producing many other types of  
CC data and products dependent on DNA and amino acid sequences. They are  
CC also used for treating diseases such as Parkinson's disease, Alzheimer's  
CC disease and other neurodegenerative diseases, anaemia, platelet  
CC disorders, wounds, ulcers, osteoporosis, autoimmune diseases or  
CC cancer. The nucleic acids may also be used as hybridisation probes or  
CC primers, and in the recombinant production of a protein. The polypeptides  
CC are also useful in generating antibodies, as molecular weight markers,  
CC and as food supplements. The present sequence represents a specifically  
CC claimed human cDNA sequence of the invention. Note: The sequence data for  
CC this patent did not form part of the printed specification, but was  
CC obtained in electronic format directly from WIPO at  
CC ftp.wipo.int/pub/published\_pct\_sequences.

XX  
CC The invention relates to an isolated nucleic acid comprising at least 10  
CC contiguous nucleotides of any of the 233 polynucleotide sequences given  
CC in the specification, or its complement. The nucleic acids encode cancer-  
CC associated proteins. Also included are an expression vector comprising  
CC the isolated nucleic acid cited above, a host cell comprising the above  
CC recombinant nucleic acid or expression vector, a microarray for detecting  
CC a cancer-associated (CA) nucleic acid comprising at least one probe  
CC comprising at least 10 contiguous nucleotides of any of the above-  
CC mentioned nucleotide sequences, an isolated polypeptide (encoded within  
CC an open reading frame of a CA sequence selected from any of the 95  
CC polynucleotide sequences as mentioned in the specification, or its  
CC complement), an isolated antibody, (or its antigen binding fragment) that  
CC binds to the above polypeptide, a hybridoma that produces the above  
CC monoclonal antibody, a pharmaceutical composition comprising the above  
CC antibody and a pharmaceutical excipient, a kit for detecting cancer  
CC cells/comprising the antibody cited above, methods for diagnosing cancer  
CC or for detecting the presence or absence of cancer cells in an  
CC individual, a method for inhibiting growth of cancer cells in an  
CC individual, a method for delivering a therapeutic agent to cancer cells  
CC in an individual, an electronic library comprising the above  
CC polynucleotide or polypeptide (or their fragments), methods of screening  
CC for anticancer activity or for a bioactive agent capable of modulating  
CC the activity of a CA protein (CAP), methods for detecting cancer  
CC associated with expression of a polypeptide in a test cell sample, a  
CC method for treating cancer and a method for inhibiting the expression of  
CC a CA gene in a cell. The composition and methods are useful for detecting,  
CC diagnosing, preventing and treating cancer, especially lymphoma and  
CC leukemia. These may also be used in screening for agents that modulate  
CC cancer. The present sequence is a mouse CAP genomic sequence. Note: The  
CC sequence data for this patent did not form part of the printed  
CC specification, but was obtained in electronic format directly from WIPO  
CC at ftp.wipo.int/pub/published\_Pct\_sequences

PT Characterizing the state of a neoplastic disease in a subject by  
PT comparing the pattern of determined expression levels of marker genes in  
PT a biological sample with reference patterns of expression levels.  
XX  
PS Claim 1; SEQ ID NO 115; 542pp; English.  
XX  
CC The invention relates to a novel method for characterizing the state of a  
CC neoplastic disease in a subject comprising determining the pattern of  
CC expression levels of at least 6, 8, 10, 15, 20, 30, 47 or 67 marker genes  
CC in a biological sample, comparing the pattern of expression levels with  
CC reference patterns of expression levels and characterizing the state of  
CC the neoplastic disease in the subject from the outcome of the comparison.  
CC The method of the invention demonstrates cytostatic applications and may  
CC be useful in characterizing the state of a neoplastic disease in a  
CC subject, preferably breast cancer, in gene therapy and for screening for  
CC compounds having a curative effect on a neoplastic disease. The current  
CC sequence is that of the human breast cancer marker ZAP3 DNA of the  
CC invention which is differentially expressed in neoplastic tissue.

XX XX
XX PT New combination comprising cDNAs that are differentially expressed in
XX prostate cancer, useful for diagnosing, treating or monitoring the
XX progression of treatment of prostate cancer.
XX XX
XX PS Claim 5; SEQ ID NO 147; 42pp; English.
XX XX
XX CC The invention relates to a combination comprising a number of cDNAs
XX expressed in prostate cancer. The invention also relates to a method for
XX detecting differential expression of one or more cDNAs in a sample
XX containing nucleic acids by hybridising a substrate with the nucleic
XX acids, thus forming one or more hybridisation complexes, detecting
XX hybridisation complex formation and comparing the complexes formed with
XX standard complexes, where differences between the standard and the sample
XX complex formation indicate differential expression of cDNAs in the
XX sample. The differential expression is diagnostic of prostate cancer. The
XX invention also relates to proteins and antibodies related to the cDNAs.
XX CC The combination is useful for diagnosing, treating or monitoring the
XX progression of treatment of prostate cancer. The antibodies are useful
XX for detecting prostate cancer. This sequence represents a human prostate
XX cancer CDNA of the invention.

XX XX
XX PT New isolated nucleic acid molecule, useful for drug screening and
XX toxicity assays or for assessing the impact, including toxicity, of a
XX compound, pharmaceutical agent or environmental pollutant on a cell or
XX living organism.
XX PS
XX PS Claim 1; SEQ ID NO 10622; 41pp; English.
XX XX
XX CC This invention is related to a novel isolated canine nucleic acid
XX sequences and the construction of canine microarrays containing a
XX significant portion of the canine genome. The isolated canine nucleic
XX acid sequences of the invention may be useful for drug screening and
XX toxicity assays. The invention is therefore useful for assessing the
XX impact, including toxicity, of a compound, pharmaceutical agent or
XX environmental pollutant on a cell or living organism. The methods are
XX useful for detecting genes that are up- or down-regulated in canines in a
XX disease state. The sequences are useful as diagnostic agents or markers
XX to detect a cellular response in a sample individually or as part of a
XX gene expression profile. It is also useful as a target for agents that
XX modulate gene expression or activity. The database is useful for
XX producing electronic Northern that allow the user to determine the cell
XX type or tissue in which a given gene is expressed and to allow
XX determination of the abundance or expression level of a given gene in a
XX particular tissue or cell. The methods are useful for determining the
XX similarity of a toxic response to one or more individual compounds. The
XX methods are useful for predicting at least one toxic response or the
XX likelihood that a compound or test agent will induce various specific
XX pathologies such as those of the liver (liver necrosis, fatty liver
XX disease, protein adduct formation or hepatitis), those of the kidney,
XX heart, brain or testes, or other pathologies associated with at least one
XX of the toxins. The methods are also useful for predicting or elucidating
XX the potential cellular pathways influenced, induced or modulated by the
XX compound or test agent due to the similarity of the expression profile
XX compared to the profile induced by a known toxin. The present sequence is
XX that of a canine DNA sequence which was claimed for use during the
XX production of a canine microarray of the invention. Note: The sequence
XX data for this patent does not form part of the printed specification but
XX was obtained in electronic format directly from WIPO at
XX ftp.wipo.int/pub/published_pct_sequences

 PT disorders and cancer and for use in stem cell survival, bone marrow and  
 PT remodeling.  
 XX  
 PS Claim 1; Page 132; 228pp; English.  
 XX  
 XX The invention relates to novel isolated bone marrow-expressed  
 CC polynucleotide (I) (or its complement) comprising a sequence selected  
 CC from 150 sequences of defined base pair sequences given in the  
 CC specification, its mature coding portion or active domain coding portion.  
 CC (I) provided as a collection on a nucleic acid array is useful for  
 CC detecting full-matches or mismatches to any one of the polynucleotides in  
 CC the collection. (I) and its encoded polypeptides (II) are useful for  
 CC treating inflammatory conditions such as arthritis, nephritis, Crohn's  
 CC disease, ischaemia-reperfusion injury, shock, sepsis, immune responses,  
 CC and are involved in increasing haematopoiesis, stem cell survival, bone  
 CC growth and remodeling. (II) is involved in cancer cell generation and  
 CC proliferation in metastasis. (I), (II) and modulators of (I) are useful  
 CC for prophylaxis or treatment of cancer. (I) is also useful for creating  
 CC transgenic animals useful for studying the in vivo activities of the  
 CC polypeptide as well as for studying modulators of the polypeptides. (II)  
 CC induces the proliferation of neural cells and regeneration of nerve and  
 CC brain tissue and is useful for the treatment of central and peripheral  
 CC nervous system diseases and neuropathies, such as Alzheimer's,  
 CC Parkinson's disease, Huntington's disease and amyotrophic lateral  
 CC sclerosis. (II) is involved in chemotactic or chemokinetic activity,  
 CC regulation of haematopoiesis and is useful for treating myeloid or  
 CC lymphoid cell disorders, platelet disorders such as thrombocytopenia and  
 CC growth, and in tissue repair, healing of burns, incisions, ulcers, for  
 CC treating osteoporosis, osteoarthritis, bone degenerative disorders or  
 CC periodontal disease. (II) is also useful for gut protection or  
 CC regeneration and treatment of lung or liver fibrosis, reperfusion injury  
 CC in various tissues, various immune deficiencies and disorders including  
 CC severe combined immunodeficiency (SCID), bacterial or fungal infections,  
 CC and autoimmune disorders e.g. multiple sclerosis. AA54326-AA54345

 XX New recombinant DNA constructs useful in the field of biochemistry and  
 PT genetic, and in particular for producing transgenic plants with improved  
 PT biological characteristics.  
 XX Claim 1; SEQ ID NO 5195; 14pp; English.  
 XX The invention relates a recombinant DNA construct comprising a  
 CC polynucleotide having any of 5544 nucleotide sequences (CDNAs SEQ ID NO:  
 CC 1-5544) and encoding a polypeptide with any of 5544 amino acid sequences  
 CC (SEQ ID NO: 5545-11088). The CDNAs and proteins are from corn, soybean,  
 CC Arabidopsis, wheat and rape but the specification does not indicate which  
 CC sequences is derived from which organism. Also included is a method of  
 CC producing a plant having an improved property, comprising transforming a  
 CC plant with a recombinant DNA construct comprising a promoter region  
 CC functional in a plant cell operably joined to a polynucleotide encoding a  
 CC polypeptide associated with the property, and growing the transformed  
 CC plant. The property is selected from improving plant cold tolerance, for  
 CC manipulating growth rate in plant cells by modification of the cell cycle  
 CC pathway, for improving plant drought tolerance, for providing increased  
 CC resistance to plant disease, for galactomannan production, for production  
 CC of plant growth regulators, for improving plant heat tolerance, for  
 CC improving plant tolerance to herbicides, for increasing the rate of  
 CC homologous recombination in plants, for lignin production, for improving  
 CC plant tolerance to extreme osmotic conditions, for improving plant  
 CC tolerance to pathogens or pests, for yield improvement by modification of  
 CC photosynthesis, for modifying seed oil yield and/or content, for  
 CC modifying seed protein yield and/or content, for yield improvement by  
 CC modification of carbohydrate, nitrogen or phosphorus use and/or uptake  
 CC and for yield improvement by providing improved plant growth and  
 CC development under at least one stress condition. The polynucleotide may  
 CC also encode a plant transcription factor. The methods and compositions of  
 CC the present invention are useful in the field of biochemistry and  
 CC genetics, in particular for producing transgenic plants with improved  
 CC biological characteristics such as increased yield, improved nitrogen  
 CC flow, increasing plant tolerance to cold or heat, improving plant  
 CC tolerance to extreme osmotic and drought conditions, and improving plant  
 CC tolerance to plant pests or pathogens. They can also be used in physical  
 CC arrays of molecules, plant breeding markers, computer-based storage and  
 CC analysis systems. The present sequence is one of the 5544 plant cDNA  
 CC sequences of the invention. Note: The sequence data for this patent did  
 CC not form part of the printed specification, but was obtained in  
 CC electronic format directly from USPTO at  
 CC seqdata.uspto.gov/sequence.html?docID=20040216190.

 XX New isolated polynucleotide and encoded polypeptides, useful in  
 PT diagnostics, forensics, gene mapping, identification of mutations  
 PT responsible for genetic disorders or other traits and to assess  
 PT biodiversity.  
 XX Claim 1; SEQ ID NO 14809; 103pp; English.  
 XX The invention relates to isolated polynucleotide (I) and polypeptide (II)  
 CC sequences. (I) is useful as hybridisation probes, polymerase chain  
 CC reaction (PCR) primers, oligomers, and for chromosome and gene mapping,  
 CC and in recombinant production of (II). The polynucleotides are also used  
 CC in diagnostics as expressed sequence tags for identifying expressed  
 CC genes. (I) is useful in gene therapy techniques to restore normal  
 CC activity of (II) or to treat disease states involving (II). (II) is  
 CC useful for generating antibodies against it, detecting or quantitating a  
 CC polypeptide in tissue, as molecular weight markers and as a food  
 CC supplement. (II) and its binding partners are useful in medical imaging  
 CC of sites expressing (II). (I) and (II) are useful for treating disorders  
 CC involving aberrant protein expression or biological activity. The  
 CC polypeptide and polynucleotide sequences have applications in  
 CC diagnostics, forensics, gene mapping, identification of mutations  
 CC and to produce other types of data and products dependent on DNA and  
 CC amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic  
 CC coding sequences of the invention. Note: The sequence data for this  
 CC patent did not appear in the printed specification, but was obtained in  
 CC electronic format directly from WIPO at

DR New isolated nucleic acid detection reagent for detecting 1000 or more

PT genes from Drosophila and for elucidating cell signaling and cell-cell

XX interactions.

PS Claim 1; SEQ ID NO 29827; 21pp + Sequence Listing; English.

XX The invention relates to an isolated nucleic acid detection reagent

CC capable of detecting 1000 or more genes from Drosophila. The invention is

CC useful in developmental biology and in elucidating cell signaling and

CC cell-cell interactions in higher eukaryotes for the development of

CC insecticides, therapeutics and pharmaceutical drugs. The invention

CC discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA

CC sequences (ABL01840-ABL16175) and the encoded proteins (ABBS7737-

CC ABBS72072). The sequence data for this patent did not form part of the

CC printed specification, but was obtained in electronic format directly

CC AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I)  
CC amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic  
CC activity, and can be used in gene therapy and vaccine production. (I)  
CC proteins, and polynucleotides may be used in the prevention, diagnosis and  
CC treatment of diseases associated with inappropriate (I) expression. For  
CC example, they may be used to treat disorders associated with decreased  
CC expression by rectifying mutations or deletions in a patient's genome  
CC that affect the activity of (I) by expressing inactive proteins or to  
CC supplement the patient's own production of (I). Additionally, (I)  
CC polynucleotides may be used to produce the secreted (I), by inserting the  
CC nucleic acids into a host cell and culturing the cell to express the  
CC protein. (I) proteins and polynucleotides may be used to prevent,  
CC diagnose and treat immune/haematopoietic-related diseases, especially  
CC cancers and cancer metastases of haematopoietic-derived cells. AAK64703  
CC to AAK87694 represent human immune/haematopoietic antigen genomic  
CC sequences from the present invention. AAK54942 to AAK54950 and AAM82169  
CC represent sequences used in the exemplification of the present invention

XX PT Retroviral vector for delivering one or more nucleotides of interest to a
PT target site has functional and non-functional splice donor and splice
PT acceptor sites.
XX PS Example 8, Fig 33, 148pp; English.
XX CC The specification describes a retroviral vector which comprises a
XX CC nucleotide sequence of interest flanked by functional splice donor sites
XX CC and functional splice acceptor sites. The vector is derived from a
XX CC retroviral pro-vector. The retroviral vector is useful for preparing
XX CC pharmaceutical compositions to deliver one or more nucleotide sequences
XX CC of interest to a target site. The retroviral vectors are especially useful
XX CC for treating inflammatory disorders, cancers, dermatological disorders,
XX CC cardiovascular disorders, autoimmune diseases and neurological disorders.
XX CC The retroviral vector is useful in gene therapy. The present sequence
XX CC represents the retroviral vector pTRONIN, a vector of the invention

XX PI Mollenhauer J, Pouetka A;
XX DR WPI; 1998-399136/34.
XX PT Proteins containing scavenger receptor, cysteine rich domain - useful for
PT diagnosis and treatment of tumors.
XX PS Disclosure; Fig 5c; 54pp; German.
XX CC This nucleotide sequence contains a fragment of a gene which is capable
XX CC of encoding a protein which contains a SRCR (scavenger receptor, cysteine
XX CC rich) domain. The gene and encoded protein can be used to diagnose or
XX CC treat tumors, particularly of the nervous system (medullo-blastoma or
XX CC glioma) or breast. The DNA sequence and probes derived from it, are used
XX CC to identify genes that express SRCR-domain containing proteins, to
XX CC determine the form in which these proteins exist and to assess the
XX CC significance of individual forms on cellular properties. The protein can
XX CC be used to detect the presence of autoantibodies and antibodies which
XX CC regulate its expression

XX Recombinant nucleic acid useful for diagnosis and treatment of carcinoma
XX comprises a nucleotide sequence.
XX Claim 1; SEQ ID NO 2017; opp; English.
XX The present invention relates to novel DNA and protein sequences which
XX are associated with carcinomas. The sequences are useful for: (i) for
XX screening drug candidates; (ii) for screening of bioactive agent capable
XX of binding to Carcinoma Associated Protein (CAP); (iii) for screening of
XX a bioactive agent capable of modulating the activity of CAP; (iv) for
XX evaluating the effect of a candidate carcinoma drug; (v) for diagnosing
XX carcinoma; (vi) for inhibiting the activity of CAP; (ix) as a biochip;
XX (x) for diagnosing carcinoma or a propensity to carcinoma; and (xi) for
XX determining Carcinoma Associated (CA) gene copy number. In addition, the
XX CA genes are useful as DNA vaccines and the CAP are useful as markers of
XX carcinoma including lymphoma. The present sequence is one such CA coding
XX sequence. Note: This patent is an equivalent to basic patent
XX US2002182586A1, for which no sequence data was published

XX Nucleic acid array useful for detecting cancer associated nucleic acid,  
PT comprises two or more nucleic acid probes.  
XX  
XX  
XX Disclosure; SEQ ID NO 830; 198pp; English.  
XX  
XX The invention relates to a nucleic acid array for detecting a cancer  
CC associated (CA) nucleic acid, comprising two or more nucleic acid probes.  
CC The invention also relates to a peptide array comprising two or more  
CC isolated polypeptides encoded by a CA nucleic acid sequence, a compound  
CC that binds to a polypeptide, an isolated antibody or its fragment which  
CC binds to a polypeptide, which is prepared by immunizing a host animal  
CC with a composition comprising the polypeptide or its antigen binding  
CC fragment and collecting cells from the host expressing antibodies against  
CC the antigen or its antigen binding fragment, a composition comprising the  
CC antibody and a carrier, a method of screening for anticancer activity, a  
CC method of detecting a CA nucleic acid, a method of diagnosing cancer, a  
CC method of treating cancer and a method of inhibiting expression of a CA  
CC nucleic acid in a cell. The CA nucleic acids are useful for detecting CA  
CC nucleic acid. The antibody is useful for detecting the presence or  
CC absence of cancer cells in an individual which involves contacting cells  
CC from the individual with the antibody and detecting a complex of a CA  
CC protein from the cancer cells and the antibody, where the detection of  
CC the complex correlates with the presence of cancer cells in the  
CC individual. The composition is useful for inhibiting growth of cancer  
CC cells in an individual or for delivering a therapeutic agent to cancer  
CC cells in an individual. The invention is also useful for diagnosing  
CC cancer, for treating cancer and for inhibiting expression of a CA gene in  
CC a cell. This sequence represents murine cancer-associated genomic DNA of  
CC the invention.

XX
XX Oligonucleotide sequences which bind nuclear proteins and surfactants
PT found in lung cells, useful for detecting cancers that originate in the
PT lung.
XX
XX Example 5; Fig 34a; 76pp; English.
XX
XX The invention relates to an oligonucleotide which includes at least 1
CC nucleic acid sequence which binds to at least 1 nuclear protein found in
CC lung cells (e.g. the thyroid transcription factor 1, TTF-1, protein). The
CC oligonucleotide can be expressed in lung cells via a vector and can be
CC used to target therapeutic agents to kill lung or thyroid cancer cells.
CC The oligonucleotide can be used to detect or diagnose lung or thyroid
CC cancer. The oligonucleotides may be designed from the sequences of, for
CC example, the promoters of lung-specific genes such as those encoding
CC surfactant proteins. The present sequence is a mutated oligonucleotide
CC from human surfactant protein B, SPB, promoter used in an EMSA
CC (electrophoretic mobility shift assay) assay to confirm the presence of
CC TTF-1 binding sites in the SPB promoter. The TTF-1 site has been mutated

CC The present invention describes substantially purified human proteins  
CC (referred to as open reading frame, ORFX, where X is 1-1191 (see Table 1  
CC in the specification). ABR15762 to ABR27252 encode the human ORFX  
CC proteins given in ABR00010 to ABR11500. ORFX proteins are useful for  
CC treating or preventing a pathology associated with an ORFX-associated  
CC disorder in humans, and in the manufacture of a medicament for treating a  
CC syndrome associated with ORFX-associated disorder. ORFX polynucleotide  
CC sequences can be used in gene therapy. ORFX sequences can be used in the  
CC treatment of cancer, hyperproliferative disorders, cirrhosis of liver,  
CC psoriasis, benign tumours, keloid, degenerative disorders, haemorrhage,  
CC osteoarthritis, neurodegenerative disorders, diabetes mellitus, systemic  
CC lupus erythematosus, hypertension, hypothyroidism, cholesterol ester  
CC storage diseases, various immune deficiencies and disorders, infectious  
CC diseases, autoimmune disorders such as multiple sclerosis, rheumatoid  
CC arthritis, autoimmune thyroiditis, myasthenia gravis, graft-versus-host  
CC disease and autoimmune inflammatory eye disease. ORFX proteins are also  
CC useful for treating burns, incisions, ulcers, for treating osteoporosis,  
CC bone degenerative disorders, or periodontal disease, and for gut  
CC protection or regeneration and treatment of lung or liver fibrosis,  
CC reperfusion injury in various tissues and conditions resulting from  
CC systemic cytokine damage. N.B. The sequence data for this patent did not  
CC form part of the printed specification, but was obtained in electronic  
CC format directly from WIPO at [ftp.wipo.int/pub/published\\_poc\\_sequences](http://wipo.int/pub/published_poc_sequences)

PT Novel human polynucleotides that correspond to human gene trapped  
PT sequences useful for gene discovery, gene therapy, as markers for gene

PT expression analysis, forensic analysis and determining genetic basis of  
PT diseases.  
XX  
PS Claim 1; SEQ ID NO 436; 36pp; English.  
XX  
XX This invention describes isolated or purified polynucleotides  
CC corresponding to human gene trapped sequence (GTS) comprising a sense or  
CC antisense sequence chosen from 1000 sequences or its fragment of 8  
CC contiguous nucleotides. GTSs are useful for gene discovery and as markers  
CC for gene expression analysis, identifying and mapping the coding regions  
CC of the mammalian and particularly human, genome, forensic analysis, for  
CC cross species hybridisation analysis, genetic manipulation, antisense  
CC inhibition, gene targeting, identification or generation of full-length  
CC cDNA, mapping the human genome, gene or antisense therapy, gene delivery  
CC and determining the genetic basis of human disease. Portion of the GTS  
CC sequences are useful as a hybridisation probe or for chromosome mapping,  
CC and can be incorporated into phase display system that can be used to  
CC screen for proteins, or other ligands, that are capable of binding an  
CC amino acid sequence encoded by the GTS sequences. The GTS sequences are  
CC also useful to regulate gene expression, as a part of ribozyme and/or  
CC triple helix sequences that can be used to regulate gene expression, as  
CC components of diagnostic methods, for analysing single nucleotide  
CC polymorphisms, and also as genetic markers for prenatal analysis of  
CC congenital traits or defects. The polynucleotides of the invention are  
CC useful for diagnosis, prognosis of disorders involving developmental and  
CC differentiation processes and for the identification of subjects having a  
CC predisposition to such disorders. Diseases or natural processes that can  
CC be correlated with the expression of mutant or normal, variants of GTSs  
CC include, aging, cancer, autoimmune disease, Crohn's disease, multiple  
CC sclerosis, immune disorders, cardiovascular disease, degenerative diseases  
CC arthritis, atherosclerosis, cardiovascular disease, osteoporosis,  
CC of the neural or skeletal systems, Alzheimer's disease, osteoporosis,  
CC asthma, and infections. GTSs can also be used to identify the specific  
CC locations of exon splice junctions, which are important in the study of  
CC disease and cancer. Modulating the level of expression of one or more  
CC genes and/or regulating activity of one or more peptides or proteins is  
CC useful for modifying development and cell differentiation disorders. ABX4402-ABX65401  
CC development and cell differentiation disorders. ABX4402-ABX65401  
CC represent the human gene trapped cDNA sequences described in the  
CC disclosure of the invention. NOTE: The sequence data for this patent did  
CC not form part of the printed specification but was obtained in electronic  
CC format directly from USPTO at

 XX New polynucleotides, useful as hybridization probes, oligomers or  
 PT primers, for chromosome or gene mapping, for the recombinant production  
 of proteins, and for generating antisense DNA or RNA.  
 PS Example 2; SEQ ID NO 2229; 571pp; English.  
 CC The present invention describes isolated polynucleotide sequences (I),  
 CC which encode polypeptides (II) with biological activity. Also described:  
 CC (1) a vector comprising (I); (2) an expression vector comprising (I); (3)  
 CC a host cell genetically engineered to comprise (I) which is operatively  
 CC associated with a regulatory sequence that modulates expression of (I) in  
 CC the host cell; (4) a polypeptide (II) encoded by (I); (5) a composition  
 CC comprising the polypeptide of (4) and a carrier; (6) an antibody directed  
 CC against the polypeptide of (4); (7) detecting (I) or the polypeptide of  
 CC (4) in a sample; (8) identifying a compound that binds to the polypeptide  
 CC of (4); (9) producing the polypeptide of (4); and (10) a collection of  
 CC polynucleotides comprising at least one of the polynucleotide sequences  
 CC (I). The polynucleotides (I) can be used as hybridization probes,  
 CC oligomers or primers, for chromosome or gene mapping, for the recombinant  
 CC production of proteins, and for generating antisense DNA or RNA. The  
 CC present sequence represents a human contig polynucleotide sequence, which  
 CC is used in an example from the present invention.

 CC and immunostimulants; and a polypeptide (II) of a ovarian tumour  
 CC polypeptide encoded by a polynucleotide (III) having a cDNA sequence (S1)  
 CC from the 10912 nucleotide sequences as given in ABL77023 to ABL87934,  
 CC (III) encoding (II) having a sequence (S2), a T cell population of (II),  
 CC or antigen presenting cells that express (II). (I) has cytostatic  
 CC activity. An oligonucleotide (IV) that hybridises to (S1) can be used for  
 CC detecting ovarian cancer in a patient's biological sample preferably  
 CC serum or ovarian tissue. The method comprises contacting a biological  
 CC sample from a patient with (IV), detecting the amount of polynucleotide  
 CC hybridising to (IV) and comparing the amount to a predetermined cutoff  
 CC value and thereby detecting ovarian cancer in the patient, where the  
 CC amount of polynucleotide hybridising to (IV) is detected preferably by  
 CC polymerase chain reaction (PCR). (I) comprising (III) and/or (II) is  
 CC useful for stimulating and/or expanding T cells specific for an ovarian  
 CC tumour protein comprising contacting T cells with (III) or (II). (III) is  
 CC useful in design and preparation of ribozyme molecules for inhibiting  
 CC expression of the tumour polypeptides and proteins in tumour cells; and  
 CC to isolate a full length gene from a suitable library e.g., a tumour cDNA  
 CC library using well known techniques

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

 /note="Vector: pBluescript II SK+; Site 1: EcoRI; Site 2: XhoI; The Clark NIL was constructed and seed was provided by Dr. J. Specht, University of Nebraska (Shomaker and Specht, 1995). The cDNA library was constructed from mRNA isolated from whole seedlings of 1 week old greenhouse grown plants. Complementary DNA was synthesized from mRNA using a primer consisting of a poly(dT) sequence with a XhoI restriction site and a 3' anchor. EcoRI adapters were ligated to the blunt-ended cDNA fragments followed by XhoI digestion. The cDNA fragments were directionally cloned into the EcoRI-XhoI restriction site of the pBluescript vector. The ligated cDNA fragments were transformed into DH10B host cells (GibcoBRL). The library was constructed in cooperation with Dr. Paul Keim's laboratory at Northern Arizona University."

A backbone of the vector is basically from pBluescript II (KS), that was in vivo excised from a 1-FLC phage vector (Carlini et al., 2001). 5' end of the cDNA that was digested with XhoI was ligated to SalI site of the vector and the 3' end including polyA tail was ligated to BamHI site of the vector (5'-gagagagagagatccacccctggagagatgtttttttttttttt-3' was used as a 1st 3' primer, and 5'-gggttcgagatcgatcgctgttccagacagcagatgactcgagAACGNNNN-3' as 2nd 5'-hairpin primer, giving the following 5' boarder sequence, AGGCCAATCGCCGCGATCGAATCGCGAACCG). cDNA insert could be amplified with conventional T7 and T3 primers. This full-length cDNA library was generated according to the method described in Nishiyama et al. (2003).  
Protonemata were blended by the POLYTRON, and then cultivated on the BODDAG medium for 13-14 days under the continuous light. These clones are available from RIKEN Bio Resource Center (<http://www.brc.riken.go.jp/lab/epd/Eng/index.html>). The database of Physcomitrella EST clones is available at the PhysCObase (<http://mos.nibb.ac.jp>).

The library was characterised by oligonucleotide fingerprinting (ONFP) to reduce sequencing redundancy. According to the ONFP procedure, clones that display the same hybridisation matrix with a battery of 200 8mer oligonucleotides are grouped into clusters. One clone per ONFP cluster was selected for sequencing. cDNA clones and filters are distributed via Deutsches Ressourcenzentrum fuer Genomforschung GmbH (<http://www.rzpd.de>).

Keck Center, University of Illinois Urbana-Champaign and S. Degrelle, BPR, Institut National de la Recherche Agronomique, France, as described in Bonaldo, M.F., Lennon, G. and Soares, M.B. (1996), Genome Research 6(9): 791-806. This clone is from library BE04, a normalized library of embryonic tissues subtracted with 7800 known placental EST sequences and 5000 clones from the BE03 library. The double stranded cDNA was size selected (more than 450 bp), adapted with EcoRI adaptors at both ends and then digested with NotI. The cDNA was then directionally cloned into EcoRI-NotI digested pGEMZf1(+). phagendic vector. Insert size was between 450-2200 bp. Sequencing was done from the 5' end of the clone. Tagged oligo-dT was used to identify the source of the ESTs where possible. (A18)TGGCT = extraembryonic tissue; (A18)TGGCT = 36-day old fetus; (A18)TGGCA = 64-day old fetus (organs); (A18)TGGCA = 64-day old fetus (body)"

Double-stranded cDNAs were synthesized with an Oligo(dT) primer [Invitrogen: 5'-  
pACTGATGTTAGATCGCAGCGCGCCCTTTTCTTTT-3'] from 24.9 microgram of total RNA, treated with T4 DNA polymerase, and purified by ethanol-precipitation. The cDNAs were ligated to lone-linker L0-Sal3 (Ref. Development 127:1737-1749 (2000) [PMID: 10725249]), purified by phenol/chloroform, and separated from free linkers by Centricon 100. Then, the cDNAs were digested with SalI and NotI enzymes, and cloned into SalI and NotI site of pSPORT1 plasmid vector. The DH10B E. coli host was transformed with ligation mixture by the chemical method. The average insert size is about 1.8 kb. The library was constructed by Yulan Piao (NIA)."

amplified with conventional T7 and T3 primers. This full-length cDNA library was generated according to the method described in Nishiyama et al. (2003). Protonemata were blended by the POLYTRON, and then cultivated on the BCGATG medium for 13-14 days under the continuous light. These clones are available from RIKEN Bio Resource Center (<http://www.brc.riken.go.jp/lab/epd/Eng/index.html>). The database of Physcomitrella EST clones is available at the PHYSCObase (<http://moss.nibb.ac.jp/>).

/clone\_lib="Bovine Lambda Zap Express corpus luteum cDNA library"  
/note="Organ: Corpus luteum; Vector: Lambda ZAP Express; Site 1: EcoRI, Site 2: XhoI; A bovine corpus luteum cDNA library was constructed using the Lambda Zap Express/GigaPack cloning kit (Stratagene cloning systems). cDNA synthesis was carried out using an oligo-(dT) primer for the reverse transcription of 5'g of mRNA and the library was constructed by directional cloning EcoRI-XhoI based on manufacturers instructions. An insert:vector ligation ratio of 1:5 was chosen as most optimum. The lambda library was packaged with GigaPack III gold packaging extracts and plated on the E. coli cell line XL1-Blue MRF".

Pred. No. is the number of results predicted by chance to have a  
score greater than or equal to the score of the result being printed,  
and is derived by analysis of the total score distribution.

NS16SR      1474 bp      DNA      linear      BCT 23-FEB-1995
LOCUS      NS16SR
DEFINITION Nitrosospiira briensis (strain C-128) 16S ribosomal RNA (16S rRNA)
gene.
ACCESSION  U35505.1 GI:530899
VERSION     16S ribosomal RNA; ribosomal RNA; small subunit.
KEYWORDS    Nitrosospiira briensis
SOURCE      Nitrosospiira briensis
ORGANISM    Bacteria; Proteobacteria; Betaproteobacteria; Nitrosomonadales;
            Nitrosomonadaceae; Nitrosospiira.
REFERENCE   1 (bases 1 to 1474)
AUTHORS     Teebe, A., Alm, E., Regan, J.M., Toze, S., Rittmann, B.E. and Stahl, D.A.
TITLE       Evolutionary relationships among ammonia- and nitrite-oxidizing
            bacteria
JOURNAL     J. Bacteriol. 176 (21), 6623-6630 (1994)
PUBMED     7961414
COMMENT     Original source text: Nitrosospiira briensis (strain C-128) DNA.

TITLE Identification of bacteria responsible for ammonia oxidation in  
freshwater aquaria  
JOURNAL Appl. Environ. Microbiol. 67 (12), 5791-5800 (2001)

JOURNAL PUBMED 11722936  
REFERENCE 2 (bases 1 to 1457)  
AUTHORS Burrell, P.C., Phalen, C.M. and Hovanec, T.A.  
TITLE Direct Submission  
JOURNAL Submitted (30-MAY-2001) Aquatic Research Laboratory, The Aquaria  
Group, 6100 Condon Dr., Moorpark, CA 93021, USA  
LOCATION/Qualifiers

## FEATURES

source  
1. 1457  
/organism="Nitrosomonas sp. R7c140"  
/mol\_type="genomic DNA"  
/isolation\_source="ammonia-oxidizing bacteria isolated  
from freshwater aquaria enrichments"  
/db\_xref="taxon:180543"  
/clone="R7c140"  
/environmental\_sample  
<1..>1457  
/product="16S ribosomal RNA"

XX  
XX This sequence represents a 16S rDNA sequence derived from an ammonia  
CC oxidising bacteria (AOB). This sequence may be used in a composition  
CC which comprises an isolated bacterial strain that oxidises ammonia to  
CC nitrite. The composition may be used for alleviating or preventing the  
CC accumulation of ammonia in a medium. The ammonia is reduced by at least  
CC 30% when compared with a level of ammonia that would exist in the absence  
CC of the bacterial strain. The composition is useful for alleviating or  
CC preventing the accumulation of ammonia in aqueous environment, e.g. a  
CC freshwater or seawater aquarium.

XX New bacteria capable of oxidizing ammonia to nitrite, for preventing or  
PT alleviating the accumulation of ammonia in fresh water aquaria, seawater  
PT aquaria and waste water.  
XX  
XX  
PS Claim 2; Page 5; 62pp; English.  
CC The invention relates to 4 novel types of ammonia-oxidising bacteria  
CC (AOB) found in freshwater aquaria. The bacteria are able to oxidise  
CC ammonia to nitrite and are members of the ammonia-oxidising bacteria  
CC family of the beta subdivision of Proteobacteria. The 4 types of bacteria  
CC can be distinguished on the basis of their 16S rRNA (ribosomal RNA) gene  
CC sequences (ABA02416-ABA02419), and are classified as AOB type A (e.g.,  
CC R7clone140), type A1 (e.g., R7clone187), type B (e.g., R7clone5) and type  
CC C (e.g., R7clone47). The invention also encompasses isolated 16S rRNA  
CC gene sequences of the ammonia-oxidising bacteria of the invention,  
CC oligonucleotide probes and primers for the detection of these bacteria,  
CC and compositions comprising the bacteria. The bacteria of the invention  
CC are useful in biological filters for reducing ammonia accumulation in  
CC both freshwater and seawater aquaria. They may also be used in waste  
CC water treatment and in bioremediation processes to reduce the level of  
CC pollution caused by ammonia. The present sequences represent R7clone140,  
CC a 16S rRNA gene sequence from the type A ammonia-oxidising bacterium of  
CC the invention. (Updated on 29-AUG-2003 to standardise OS field)

XX New composition comprising an isolated bacterial strain that oxidizes

PT ammonia to nitrite, useful for alleviating or preventing the accumulation

XX of ammonia in aqueous environment.

PS Disclosure; Page 8-9; 98pp; English.

XX This sequence represents a 16S rDNA sequence derived from an ammonia

CC oxidizing bacteria (AOB). This sequence may be used in a composition

CC which comprises an isolated bacterial strain that oxidizes ammonia to

CC nitrite. The composition may be used for alleviating or preventing the

CC accumulation of ammonia in a medium. The ammonia is reduced by at least

CC 30% when compared with a level of ammonia that would exist in the absence

CC of the bacterial strain. The composition is useful for alleviating or

CC preventing the accumulation of ammonia in aqueous environment, e.g. a

CC freshwater or seawater aquarium.

PT	New composition comprising an isolated bacterial strain that oxidizes		
PT	ammonia to nitrite, useful for alleviating or preventing the accumulation		
PT	of ammonia in aqueous environment.		

PS Claim 1; Page 14; 98bp; English.

XX This sequence represents a 16S rDNA sequence derived from an ammonia  
PS oxidizing bacteria (AOB). This sequence may be used in a composition  
XX which comprises an isolated bacterial strain that oxidizes ammonia to  
CC nitrite. The composition may be used for alleviating or preventing the  
CC accumulation of ammonia in a medium. The ammonia is reduced by at least  
CC 30% when compared with a level of ammonia that would exist in the absence  
CC of the bacterial strain. The composition is useful for alleviating or  
CC preventing the accumulation of ammonia in aqueous environment, e.g. a  
CC freshwater or seawater aquarium.

PT New bacteria capable of oxidizing ammonia to nitrite, for preventing or  
PT alleviating the accumulation of ammonia in fresh water aquaria, seawater  
PS aquaria and waste water.  
PS Claim 2; Page 7; 62pp; English.  
XX The invention relates to 4 novel types of ammonia-oxidizing bacteria  
XX (AOB) found in freshwater aquaria. The bacteria are able to oxidise  
XX ammonia to nitrite and are members of the ammonia-oxidizing bacteria  
XX family of the beta subdivision of Proteobacteria. The 4 types of bacteria  
XX can be distinguished on the basis of their 16S rRNA (ribosomal RNA) gene  
XX sequences (ABAO2418-ABAO2419), and are classified as AOB type A (e.g.,  
XX R3clone140), type A1 (e.g., R3clone187), type B (e.g., R3clone5) and type  
XX C (e.g., R3clone47). The invention also encompasses isolated 16S rRNA  
XX gene sequences of the ammonia-oxidizing bacteria of the invention,  
XX oligonucleotide probes and primers for the detection of these bacteria,  
XX and compositions comprising the bacteria. The bacteria of the invention  
XX are useful in biological filters for reducing ammonia accumulation in  
XX both freshwater and seawater aquaria. They may also be used in waste  
XX water treatment and in bioremediation processes to reduce the level of  
XX pollution caused by ammonia. The present sequence represents R3clone5, a  
XX 16S rRNA gene sequence from the type B ammonia-oxidizing bacterium of the  
XX invention. (Updated on 29-AUG-2003 to standardise OS field)

CC This sequence represents a 16S rDNA sequence derived from an ammonia
CC oxidizing bacteria (AOB). This sequence may be used in a composition
CC which comprises an isolated bacterial strain that oxidizes ammonia to
CC nitrite. The composition may be used for alleviating or preventing the
CC accumulation of ammonia in a medium. The ammonia is reduced by at least
CC 30% when compared with a level of ammonia that would exist in the absence
CC of the bacterial strain. The composition is useful for alleviating or
CC preventing the accumulation of ammonia in aqueous environment, e.g. a
CC freshwater or seawater aquarium.

PT New bacteria capable of oxidizing ammonia to nitrite, for preventing or  
PT alleviating the accumulation of ammonia in fresh water aquaria, seawater  
PT aquaria and waste water.  
XX  
PS Claim 2; Page 8; 62pp; English.  
XX  
CC The invention relates to 4 novel types of ammonia-oxidising bacteria  
CC (AOB) found in freshwater aquaria. The bacteria are able to oxidise  
CC ammonia to nitrite and are members of the ammonia-oxidising bacteria  
CC family of the beta subdivision of Proteobacteria. The 4 types of bacteria  
CC can be distinguished on the basis of their 16S rRNA (ribosomal RNA) gene  
CC sequences (ABA02416-ABA02419), and are classified as AOB type A (e.g.,  
CC R3clone140), type A1 (e.g., R3clone187), type B (e.g., R3clone5) and type  
CC C (e.g., R3clone47). The invention also encompasses isolated 16S rRNA  
CC gene sequences of the ammonia-oxidising bacteria of the invention,  
CC oligonucleotide probes and primers for the detection of these bacteria,  
CC and compositions comprising the bacteria. The bacteria of the invention  
CC are useful in biological filters for reducing ammonia accumulation in  
CC both freshwater and seawater aquaria. They may also be used in waste  
CC water treatment and in bioremediation processes to reduce the level of  
CC pollution caused by ammonia. The present sequence represents R3clone47, a  
CC 16S rRNA gene sequence from the type C ammonia-oxidising bacterium of the  
CC invention. (Updated on 29-AUG-2003 to standardise OS field)

PT accumulating organism in a sample, comprises a sequence that is unique to  
PT 16S rDNA of polyphosphate accumulating organisms.  
XX  
XX  
PS Claim 4; Fig 3; 54p; English.  
XX  
XX The sequences given in AAC86021-30 represent 16S rDNA sequences from  
CC polyphosphate accumulating organisms (PAOs). Sequences which are unique  
CC to these 16S rDNA sequences are used to create a probe or primer for  
CC detecting the relevant organisms. The primer/probe sequences are useful  
CC for detecting PAO cells in a sample, by treating cells in the sample to  
CC fix cellular contents, contacting fixed cells with the primer/probe which  
CC is labelled with a radiolabel, a reporter group or a hapten, under

conditions which allow the probe to hybridize with 16S rRNA within the fixed cell, removing unhybridized probe from the fixed cells, and detecting the labeled probe-RNA hybrid by fluorescence *in situ* hybridization. The primer/probe sequences are useful for identifying PAOs that are capable of biologically removing phosphorus from waste water. Rapid assessment of the presence of a number of PAOs in a waste water sample, can be done using the primer/probe sequences. They allow quick and convenient assessment of whether a sludge or waste water sample includes PAOs and allows quantitation of PAO cells in samples. (Updated on 11-Sep-2003 to standardise OS field)

PT Microorganism belonging to Denitromonas for removal of nitrogen oxide by  
 PT reduction of nitrogen oxide to nitrogen in gas or aqueous solution, has  
 PT specific mycological characters.

PS Disclosure; Page 6-7; Bpp; Japanese.

XX The present sequence represents a fragment of 16S rDNA gene of  
 CC Denitromonas aromaticus. This is a novel microorganism belonging to the  
 CC new genus Denitromonas, and which has specific mycological characters.  
 CC The new microorganism efficiently reduces and removes nitrogen oxide. The  
 CC bacterium is used for the removal of nitrogen oxide. It reduces nitrogen  
 CC oxide to nitrogen in a gas or aqueous solution

 XX PT Novel oligonucleotide probe or primer useful for detecting polyphosphate  
 PT accumulating organism in a sample, comprises a sequence that is unique to  
 PT 16S rDNA of polyphosphate accumulating organisms.  
 XX PS Claim 4; Fig 3; 54pp; English.  
 CC The sequences given in AAc86021-30 represent 16S rDNA sequences from  
 CC polyphosphate accumulating organisms (PAOs). Sequences which are unique  
 CC to these 16S rDNA sequences are used to create a probe or primer for  
 CC detecting the relevant organisms. The primer/probe sequences are useful  
 CC for detecting PAO cells in a sample, by treating cells in the sample to  
 CC fix cellular contents, contacting fixed cells with the primer/probe which  
 CC is labelled with a radiolabel, a reporter group or a hapten, under  
 CC conditions which allow the probe to hybridize with 16S rRNA within the  
 CC fixed cell, removing unhybridized probe from the fixed cells, and  
 CC detecting the labeled probe-RNA hybrid by fluorescence in situ  
 CC hybridization. The primer/probe sequences are useful for identifying PAOs  
 CC that are capable of biologically removing phosphorus from waste water.  
 CC Rapid assessment of the presence of a number of PAOs in a waste water  
 CC sample, can be done using the primer/ probe sequences. They allow quick  
 CC and convenient assessment of whether a sludge or waste water sample  
 CC includes PAOs and allows quantitation of PAO cells in samples. (Updated  
 CC on 06-AUG-2003 to correct OS field.)

XX Novel oligonucleotide useful for specific detection of a selenic acid  
PT reducing microbe.  
XX Example 1; Page 6; 7pp; Japanese.  
XX The invention relates to an oligonucleotide that may be used for  
CC detecting Azarcus sp. strain MA-23, a selenic acid reducing microbe. The  
CC current sequence represents a sequence related to an oligonucleotide for  
CC the detection of Azarcus sp

XX PT Novel oligonucleotide probe or primer useful for detecting polyphosphate  
XX PT accumulating organism in a sample, comprises a sequence that is unique to  
XX PT 16S rDNA of polyphosphate accumulating organisms.  
PS Claim 4; Fig 3; 54pp; English.  
XX CC The sequences given in AAC86021-30 represent 16S rDNA sequences from  
XX CC polyphosphate accumulating organisms (PAOs). Sequences which are unique  
XX CC to these 16S rDNA sequences are used to create a probe or primer for  
XX CC detecting the relevant organisms. The primer/probe sequences are useful  
XX CC for detecting PAO cells in a sample, by treating cells in the sample to  
XX CC fix cellular contents, contacting fixed cells with the primer/probe which  
XX CC is labelled with a radiolabel, a reporter group or a hapten, under  
XX CC conditions which allow the probe to hybridize with 16S rRNA within the  
XX CC fixed cell, removing unhybridized probe from the fixed cells, and  
XX CC detecting the labeled probe-RNA hybrid by fluorescence in situ  
XX CC hybridization. The primer/probe sequences are useful for identifying PAOs  
XX CC that are capable of biologically removing phosphorus from waste water.  
XX CC Rapid assessment of the presence of a number of PAOs in a waste water  
XX CC sample, can be done using the primer/ probe sequences. They allow quick  
XX CC and convenient assessment of whether a sludge or waste water sample  
XX CC includes PAOs and allows quantification of PAO cells in samples. (Updated  
XX CC on 06-AUG-2003 to correct OS field.)

Pt	Noel DNA fragment of microorganisms existing in activated sludge of ammonia liquid treatment plant, useful as index microorganisms for evaluating nitrification or denitrifying capability of ammonia liquid.		
PS	Claim 45; SEQ ID NO 89; 133bp; Japanese.		
CC	This invention relates to a novel DNA fragment comprising the 357E-518R region of the 16S RNA gene of beta proteobacteria, belonging to the ammonia oxidizing bacteria group, or CFB Bacteroides where bacteria exists in activated sludge of an ammonia liquid treatment plant and used for chemical oxygen demand (COD) reduction. The invention is useful in the identification of microorganisms as nitrification or denitrifying index microorganisms for evaluating the nitrification or denitrifying capability of ammonia liquid of the activated sludge by fluorescence in situ hybridisation (FISH). The invention is also useful for developing apparatus for the processing of ammonia liquid. The DNA fragment enables evaluation of the nitrification or denitrifying capability of microorganisms. The present sequence is that of a 16S rRNA gene 357f-518r region of the invention.

XX Novel oligonucleotide probe or primer useful for detecting polyphosphate  
PT accumulating organism in a sample, comprises a sequence that is unique to  
PT 16S rDNA of polyphosphate accumulating organisms.  
XX  
PS Claim 4; Fig 3; 54pp: English.

The sequences given in AAC86021-30 represent 16S rDNA sequences from  
CC polyphosphate accumulating organisms (PAOs). Sequences which are unique  
CC to these 16S rDNA sequences are used to create a probe or primer for  
CC detecting the relevant organisms. The primer/probe sequences are useful  
CC for detecting PAO cells in a sample, by treating cells in the sample to  
CC fix cellular contents, contacting fixed cells with the primer/probe which  
CC is labeled with a radiolabel, a reporter group or a hapten, under the  
CC conditions which allow the probe to hybridize with 16S rRNA within the  
CC fixed cell, removing unhybridized probe from the fixed cells, and  
CC hybridization. The primer/probe sequences are useful for identifying PAOs  
CC that are capable of biologically removing phosphorus from waste water.  
CC Rapid assessment of the presence of a number of PAOs in a waste water  
CC sample, can be done using the primer/ probe sequences. They allow quick  
CC and convenient assessment of whether a sludge or waste water sample

CC includes PAOs and allows quantitation of PAO cells in samples

XX	
XX	Depleting or isolating targeted nucleic acids e.g. RNA, involves using a
PT	bridging oligonucleotide comprising bridging region and a targeting
PT	region complementary to a targeted nucleic acid, and a capture
PT	oligonucleotide.
XX	
XX	
PS	Claim 4; Page 171-172; 208pp; English.
CC	This invention relates to a novel method for isolating, depleting or
CC	separating a targeted nucleic acid, such as RNA, from a sample
CC	comprising targeted and non-targeted nucleic acids. It effects a way of
CC	enriching for non-targeted nucleic acids such as mRNAs. Isolating
CC	sufficient quantities of high quality bacterial mRNA is a demanding
CC	process which impedes analysis of bacterial gene expression in the
CC	presence of host cells. A small percentage of bacterial mRNAs may be poly
CC	-A tailed, but these are targeted for degradation and tend to be
CC	unstable. As a result, the commonly employed method for mRNA purification
CC	with eukaryotic cells, oligo-dt capture, is ineffective. The present
CC	invention provides an alternative, more suitable method for mRNA
CC	purification from prokaryotes. The method of the invention comprises the
CC	incubation of a sample with a bridging oligonucleotide (containing a
CC	targeting region) and subsequently incubating with a capture
CC	oligonucleotide allowing the isolation of the target from the sample. The
CC	method is useful for depleting or isolating targeted nucleic acid, for
CC	example RNA such as prokaryotic 16S or prokaryotic 23S, eukaryotic 17S
CC	or 18S or eukaryotic 28S RNA, from a sample. The RNA sequence may
CC	comprise any one of 64 fully defined sequences as given in the
CC	specification. The present sequence is that of a DNA sequence which
CC	represents the sequence of 16S RNA of Bordetella bronchiseptica related
CC	to the invention.

PT Novel oligonucleotide probe or primer useful for detecting polyphosphate
PT accumulating organism in a sample, comprises a sequence that is unique to
PT 16S rDNA of polyphosphate accumulating organisms.
XX
PS Claim 4; Fig 3; 5app; English.
XX
CC The sequences given in AAC86021-30 represent 16S rDNA sequences from
CC polyphosphate accumulating organisms (PAOs). Sequences which are unique
CC to these 16S rDNA sequences are used to create a probe or primer for
CC detecting the relevant organisms. The primer/probe sequences are useful
CC for detecting PAO cells in a sample, by treating cells in the sample to
CC fix cellular contents, contacting fixed cells with the primer/probe which
CC is labelled with a radiolabel, a reporter group or a hapten, under
CC conditions which allow the probe to hybridize with 16S rRNA within the
CC fixed cell, removing unhybridized probe from the fixed cells, and
CC detecting the labeled probe-RNA hybrid by fluorescence in situ
CC hybridization. The primer/probe sequences are useful for identifying PAOs
CC that are capable of biologically removing phosphorus from waste water.
CC Rapid assessment of the presence of a number of PAOs in a waste water
CC sample, can be done using the primer/ probe sequences. They allow quick
CC and convenient assessment of whether a sludge or waste water sample
CC includes PAOs and allows quantitation of PAO cells in samples. (Updated
CC on 06-AUG-2003 to correct OS field.)

XX
CC The specification describes the use of fragmentation-based methods and
CC systems including mass spectrometric methods for the analysis of sequence
CC variations including nucleic acid polymorphisms and mutations. The
CC fragmentation-based methods and systems of the invention are useful for
CC the analysis of sequence variations including nucleic acid polymorphisms
CC and mutations. The methods are useful for identifying a genetic disease
CC or chromosome abnormality; identifying a predisposition to a disease or
CC condition including obesity, atherosclerosis, or cancer; identifying an
CC infection by an infectious agent; providing information relating to
CC identity, heredity, or histocompatibility; identifying pathogens; or
CC determining haplotypes. ADQ16353-ADQ16361 represent Bordetella variable
CC 16S rRNA gene regions. Amplicons from this region were used to demonstrate
CC the invention. They were used to demonstrate a method for bacterial
CC typing by base-specific fragmentation.

XX Determining sequence variations in a target biomolecule or nucleic acid  
PT molecule, useful for analyzing sequence variations or polymorphisms in  
PT hemophilia, Alzheimer's disease, Cystic Fibrosis, and Down's syndrome and  
PT diabetes.  
XX  
XX Example 4; SEQ ID NO 32; 78bp; English.  
PS  
XX  
XX The invention relates to a method for determining sequence variations in  
CC a target biomolecule or nucleic acid molecule. The method comprises  
CC cleaving the target biomolecule into fragments by contacting the target  
CC biomolecule or nucleic acid molecule with one or more specific cleavage  
CC reagents, cleaving or simulating cleavage of a reference biomolecule or  
CC nucleic acid molecule into fragments with the same cleavage reagents,  
CC determining mass signals of the fragments produced, determining  
CC differences in the mass signals between the fragments produced, and  
CC determining a reduced set of sequence variation candidates from the  
CC differences in the mass signals and determining sequence variations in  
CC the target compared to the reference biomolecule or nucleic acid  
CC molecule. The methods and compositions of the present invention are  
CC useful for analyzing sequence variations and/or polymorphisms in diseases

CC such as hemophilia, thalassemia, Duchenne Muscular Dystrophy,  
CC Huntington's Disease, Alzheimer's Disease and Cystic Fibrosis, and  
CC Trisomy 21 (Down's Syndrome), Trisomy 13 (Patau Syndrome), Trisomy 18  
CC (Edward's Syndrome), Monosomy X (Turner's Syndrome) and other sex  
CC chromosome aneuploidies such as Klinefelter's Syndrome (XXY), and  
CC diabetes, arteriosclerosis, obesity, various autoimmune diseases and  
CC cancer (e.g., colorectal, breast, ovarian, lung). The present sequence  
CC represents a 16S rRNA gene sequence, which is used in an example from the  
CC present invention for the bacterial typing by base-specific  
CC fragmentation.

XX B. bronchiseptica 16S rRNA fragments - used as probes in the detection of  
PT porcine atrophic rhinitis.  
XX  
XX Claim 1; Page 8-9; 12pp; Japanese.  
XX  
CC DNA sequences (AA064009-064031) are fragments of the 16S rRNA gene from  
CC B. bronchiseptica (AA055187). The fragments are used as probes to detect  
CC porcine atrophic rhinitis caused by the Bordetella bronchiseptica  
CC bacterium. Also claimed are 3 DNA fragments complementary to the 436-466  
CC region of the 16S rRNA (AA064032-034). A specific DNA sequence from the 51  
CC rRNA was selected and 2 probes were designed (AA064035 and AA064039) for  
CC the detection of B. bronchiseptica. Primers (AA064036-37) were used to  
CC clone the 16S gene. Sequences (AA064034) is the preferred probe used in  
CC the detection process. (Updated on 27-AUG-2003 to correct OS field.)

XX Use of oligo:nucleotide(s) corresponding to bacterial 16S rRNA - for  
PT inhibiting bacterial protein expression and treating bacterial infection.  
XX  
XX Claim 26; Page 62-63; 73pp; English.  
XX  
XX This polynucleotide comprises the 16S ribosomal RNA (rRNA) gene of  
CC Burkholderia cepacia. The invention relates to methods and compositions  
CC for the treatment of Gram-negative bacterial infections employing novel  
CC oligonucleotides as antimicrobial agents. The oligonucleotides are  
CC targeted to the Shine-Dalgarno (SD) region of prokaryotes to inhibit  
CC bacterial expression and hence inhibit bacterial infection. They  
CC preferably comprise 10-35 consecutive bases of the 3' end of a bacterial  
CC 16S rRNA (see also AAV24291-94). An oligonucleotide may also include a  
CC transport moiety and may have DNA phosphate modifications to increase  
CC nuclease resistance, or may be formulated in a liposome. A claimed method  
CC for treating a bacterial infection of a patient comprises administering a  
CC liposomal formulation of such an oligonucleotide. The oligonucleotides  
CC can be used particularly for treating bacterial infections in pulmonary  
CC diseases such as cystic fibrosis or tuberculosis. Since the SD sequence  
CC is not present in eukaryotic cells, the oligonucleotides provide a  
CC pathogen-specific therapeutic method

XX Depleting or isolating targeted nucleic acids e.g. rRNA, involves using a  
XX bridging oligonucleotide comprising bridging region and a targeting  
XX region complementary to a targeted nucleic acid, and a capture  
XX oligonucleotide.  
PS Claim 4; Page 173-174; 208pp; English.  
XX  
XX This invention relates to a novel method for isolating, depleting or  
XX separating a targeted nucleic acid, such as rRNA, from a sample  
XX comprising targeted and non-targeted nucleic acids. It effects a way of  
XX enriching for non-targeted nucleic acids such as mRNAs. Isolating  
XX sufficient quantities of high quality bacterial mRNA is a demanding  
XX process which impedes analysis of bacterial gene expression in the  
XX presence of host cells. A small percentage of bacterial mRNAs may be poly  
XX -A tailed, but these are targeted for degradation and tend to be  
XX unstable. As a result, the commonly employed method for mRNA purification  
XX with eukaryotic cells, oligo-dT capture, is ineffective. The present  
XX invention provides an alternative, more suitable method for mRNA  
XX purification from prokaryotes. The method of the invention comprises the  
XX incubation of a sample with a bridging oligonucleotide (containing a  
XX targeting region) and subsequently incubating with a capture  
XX oligonucleotide allowing the isolation of the target from the sample. The  
XX method is useful for depleting or isolating targeted nucleic acid, for  
XX example rRNA such as prokaryotic 16S or prokaryotic 23S, eukaryotic 17S  
XX or 18S or eukaryotic 28S rRNA, from a sample. The rRNA sequence may  
XX comprise any one of 64 fully defined sequences as given in the  
XX specification. The present sequence is that of a DNA sequence which  
XX represents the sequence of 16S rRNA of Burkholderia cepacia related to

CC the invention.

DR
XX      Novel oligonucleotide probe or primer useful for detecting polyphosphate
PT      accumulating organism in a sample, comprises a sequence that is unique to
PT      16S rdna of polyphosphate accumulating organisms.
PS
XX      Claim 4; Fig 3; 54pp; English.
CC
XX      The sequences given in AAC86021-30 represent 16S rdna sequences from
CC      polyphosphate accumulating organisms (PAOs). Sequences which are unique
CC      to these 16S rdna sequences are used to create a probe or primer for
CC      detecting the relevant organisms. The primer/probe sequences are useful
CC      for detecting PAO cells in a sample, by treating cells in the sample to
CC      fix cellular contents, contacting fixed cells with the primer/probe which
CC      is labelled with a radiolabel, a reporter group or a hapten, under
CC      conditions which allow the probe to hybridize with 16S rdna within the
CC      fixed cell, removing unhybridized probe from the fixed cells, and
CC      detecting the labeled probe-RNA hybrid by fluorescence in situ
CC      hybridization. The primer/probe sequences are useful for identifying PAOs
CC      that are capable of biologically removing phosphorus from waste water.
CC      Rapid assessment of the presence of a number of PAOs in a waste water
CC      sample, can be done using the primer/ probe sequences. They allow quick
CC      and convenient assessment of whether a sludge or waste water sample
CC      includes PAOs and allows quantitation of PAO cells in samples

PT Algae-lysing bacteria Acidovorax temperans KFCC 11294 and method for
PT removing algae using the same microorganism.
XX
PS Example 3; SEQ ID NO 2; 1bp; Korean.
XX
CC The invention relates to a novel algae-lysing bacteria Acidovorax
CC temperans KFCC 11294 and a method for removing algae using the same
CC microorganism, thereby effectively solving environmental problems caused
CC by algae. An algae-lysing bacteria Acidovorax temperans KFCC 11294
CC containing 16S rDNA having the nucleotide sequence of AD067894 is
CC provided, wherein Acidovorax temperans KFCC 11294 is isolated from
CC Seokhon lake. A method for removing algae comprises culturing Acidovorax
CC temperans KFCC 11294 and applying the cultured medium to algae living in
CC water, where the cultured medium of Acidovorax temperans KFCC 11294 is
CC obtained by culturing Acidovorax temperans KFCC 11294 in BG-11 medium and
CC centrifuging the cultured medium. The algae is blue-green algae, and the
CC blue-green algae is Anabaena cylindrica. The present sequence represents
CC the Acidovorax temperans partial 16S rRNA gene.

PT	Depleting or isolating targeted nucleic acids e.g. rRNA, involves using a		
PT	bridging oligonucleotide comprising bridging region and a targeting		
PT	region complementary to a targeted nucleic acid, and a capture		
PT	oligonucleotide.		
XX			
PS	Claim 4; Page 173; 208pp; English.		
XX			
CC	This invention relates to a novel method for isolating, depleting or		
CC	separating a targeted nucleic acid, such as rRNA, from a sample		
CC	comprising targeted and non-targeted nucleic acids. It effects a way of		
CC	enriching for non-targeted nucleic acids such as mRNAs. Isolating		
CC	sufficient quantities of high quality bacterial mRNA is a demanding		
CC	process which impedes analysis of bacterial gene expression in the		
CC	presence of host cells. A small percentage of bacterial mRNAs may be poly		
CC	-A tailed, but these are targeted for degradation and tend to be		
CC	unstable. As a result, the commonly employed method for mRNA purification		
CC	with eukaryotic cells, oligo-dT capture, is ineffective. The present		
CC	invention provides an alternative, more suitable method for mRNA		
CC	purification from prokaryotes. The method of the invention comprises the		
CC	incubation of a sample with a bridging oligonucleotide (containing a		
CC	targeting region) and subsequently incubating with a capture		
CC	oligonucleotide allowing the isolation of the target from the sample. The		
CC	method is useful for depleting or isolating targeted nucleic acid, for		
CC	example rRNA such as prokaryotic 16S or prokaryotic 23S, eukaryotic 17S		
CC	or 18S or eukaryotic 28S rRNA, from a sample. The rRNA sequence may		
CC	comprise any one of 64 fully defined sequences as given in the		
CC	specification. The present sequence is that of a DNA sequence which		
CC	represents the sequence of 16S rRNA of Bordetella pertussis related to		
CC	the invention.

CC The present invention describes a nucleic acid molecule encoding a 16S-
XX 23S spacer DNA sequence for the bacterial species Acidovorax avenae
XX subsp. citrulli or avenae, Xanthomonas cucurbitae and Erwinia
XX tracheiphila. Also described: (1) a pair of oligonucleotide primers,
XX where at least one primer comprises 15-18, 15-22 or 20-25 bp; (2)
```

CC detecting bacterial pathogen; (3) a diagnostic kit used in detecting the  
CC bacterial pathogen; (4) a polypeptide comprising the amino acid sequence  
CC (S1, see AB11075); (5) an antibody that reacts with a polypeptide having  
CC the N-terminal amino acid sequence of the polypeptide; and (6) an  
CC immunoassay for detecting Acidovorax avenae subspecies citrullii that uses  
CC the antibody. The nucleic acid is useful in diagnostic assays for  
CC identifying Acidovorax avenae subspecies citrullii in melons. The present  
CC sequence represents an Acidovorax avenae subspecies citrullii 16S  
CC ribosomal RNA gene, which is used in the exemplification of the present  
CC invention.

XX Algae-lysing bacteria Acidovorax temperans KFC11294 and method for  
PT removing algae using the same microorganism.

XX Claim 1; SEQ ID NO 1; 1bp; Korean.

XX The invention relates to a novel algae-lysing bacteria Acidovorax  
CC temperans KFC11294 and a method for removing algae using the same  
CC microorganism, thereby effectively solving environmental problems caused  
CC by algae. An algae-lysing bacteria Acidovorax temperans KFC11294  
CC containing 16S rDNA having the nucleotide sequence of A0067894 is  
CC provided, wherein Acidovorax temperans KFC11294 is isolated from  
CC Sookchon lake. A method for removing algae comprises culturing Acidovorax  
CC temperans KFC11294 and applying the cultured medium to algae living in  
CC water, where the cultured medium of Acidovorax temperans KFC11294 is  
CC obtained by culturing Acidovorax temperans KFC11294 in BG-11 medium and  
CC centrifuging the cultured medium. The algae is blue-green algae, and the  
CC blue-green algae is Anabaena cylindrica. The present sequence represents  
CC the Acidovorax temperans KFC11294 16S rRNA gene.

PT Fixing useful genes e.g. phenol hydroxylase to micro organism ecosystems  
PT e.g. phenol decomposition activated sludge, involves isolating dominant  
PT strain in ecosystem, introducing a useful gene and returning the strain  
PT to the ecosystem.  
XX  
PS Example 2; SEQ ID NO 1; 20pp; Japanese.  
XX  
XX The invention relates to a method for fixing a useful gene in  
XX microorganisms ecosystems, comprising isolating a strain from  
XX microorganisms ecosystem, which is a dominant strain within the  
XX ecosystem, introducing a useful gene into the isolated strain and then  
XX returning the strain to the microorganisms ecosystem. The method is  
XX useful for fixing a useful gene e.g., phenyl hydroxylase gene to a strain  
XX dominant within a ecosystem, such as Comamonas sp. IN7 strain and its  
XX closely related strains. It is also useful for increasing phenol  
XX decomposition activity in a sludge, and for purifying environment  
XX contaminated with phenol. The current sequence represents a phenyl  
XX hydroxylase gene fragment.

XX  
CC The present sequence represents a fragment of the 16S rRNA gene of  
CC bacteria belonging to beta proteobacteria. The bacteria are capable of  
CC decomposing trichloroethylene with high efficiency. The bacteria are  
CC useful for purifying soil or underground water contaminated with phenol  
CC and trichloroethylene

XX
XX Isolated nucleotide sequences of Neisseria meningitidis which can be used
PT in the diagnosis and treatment of N. meningitidis infection and other
PT Neisserial infections, for example, N.gonorrhoea.
XX
XX Claim 7; Page 866-1272; 1760pp; English.
XX
XX The present invention describes methods of obtaining immunogenic proteins
CC from Neisseria genomic sequences. AAA81453 to AAA82414 represent
CC specifically claimed Neisseria meningitidis genomic DNA sequences;
CC AAA81260 to AAA81303 and AAB25620 to AAB25663 represent Neisseria DNA
CC sequences and their corresponding proteins; AAA81254 to AAA81259 and
CC AAA81304 to AAA81321 represent PCR primers used in the isolation of
CC Neisseria meningitidis DNA sequences; and AAA81322 to AAA81452 represent
CC Neisseria meningitidis Memb polynucleotide ORF sequences, which are all
CC used in the exemplification of the present invention. The nucleic acid
CC sequences, protein sequences, and antibodies against them, can be used in
CC the manufacture of a composition. The composition can be used as a
CC medicament (or in the manufacture of a medicament) for treating,
CC preventing or diagnosing infection due to Neisserial bacteria. For
CC example, some of the identified proteins could be components of vaccines
CC against Meningococcus B; against all serotypes; and/or against all
CC pathogenic Neisseriae. Identification of sequences from the bacterium
CC will also facilitate production of biological probes, particularly
CC organism-specific probes. Attempts to make efficacious Meningococcus B
CC vaccines have also been tried but none have successfully overcome
CC antigenic variability. The provision of further, complete sequences may
CC provide an opportunity to identify secreted or surface exposed proteins
CC that may be presumed targets for the immune system and which are not
CC antigenically variable or at least more conserved than other more
CC variable regions

PS Claim 7; Appendix A; 692pp; English.  
XX  
XX The present invention describes the full length genome of Neisseria  
CC meningitidis B (NMB). The sequences in AAFP21544 and AAFP21607 to AAFP21613  
CC represent fragments of the NMB genomic sequence, as the sequence was too  
CC long to go in a record on its own it was split into 8 sequences which  
CC overlap each other at the beginning and end of each sequence by 49980 bp  
CC (i.e. the last 49980 bp of AAFP21544 is repeated at the beginning of  
CC AAFP21607, the last 49980 bp of AAFP21607 are repeated at the beginning of  
CC AAFP21608, and so on). AAFP21545 to AAFP21588 encode the Neisseria proteins  
CC given in AAB58550 to AAB58593, and AAFP21589 to AAFP21606 represent PCR  
CC primers which are used in the exemplification of the present invention.  
CC The NMB genome and fragments from it have antibacterial activity, and can  
CC be used in vaccines and gene therapy. Neisseria nucleic acids, proteins  
CC and/or antibodies which binds to the proteins can be used in compositions  
CC for treating or preventing infection due to Neisserial bacteria or as a  
CC diagnostic reagent for detecting the presence of Neisserial bacteria or  
CC of antibodies raised to Neisserial bacteria. Computer, computer memory,  
CC computer storage medium or computer databases can be used in a search to  
CC identify open reading frames (ORFs) or coding sequences within the NMB  
CC genome. The DNA sequences provide further opportunities to find antigenic  
CC or immunogenic proteins which are more effective in vaccines than the  
CC outer membrane proteins currently used

XX      PT      Neisseria meningitidis B full length genome sequence and open reading
XX      PT      frames are used to detect, treat and prevent Neisserial infections.
XX      PS      Claim 7; Appendix A; 692pp; English.
XX      CC      The present invention describes the full length genome of Neisseria
XX      CC      meningitidis B (NMB). The sequences in AAF21544 and AAF21607 to AAF21613
XX      CC      represent fragments of the NMB genomic sequence, as the sequence which
XX      CC      long to go in a record on its own it was split into 8 sequences by 4980 bp
XX      CC      overlap each other at the beginning and end of each sequence by 4980 bp
XX      CC      (i.e. the last 4980 bp of AAF21544 is repeated at the beginning of
XX      CC      AAF21607, the last 4980 bp of AAF21607 are repeated at the beginning of
XX      CC      AAF21608, and so on). AAF21545 to AAF21588 encode the Neisseria proteins
XX      CC      given in AAB58550 to AAB58593, and AAF21589 to AAF21606 represent PCR
XX      CC      primers which are used in the exemplification of the present invention.
XX      CC      The NMB genome and fragments from it have antibacterial activity, and can
XX      CC      be used in vaccines and gene therapy. Neisseria nucleic acids, proteins
XX      CC      and/or antibodies which binds to the proteins can be used in compositions
XX      CC      for treating or preventing infection due to Neisserial bacteria or as a
XX      CC      diagnostic reagent for detecting the presence of Neisserial bacteria or
XX      CC      of antibodies raised to Neisserial bacteria. Computers, computer memory,
XX      CC      computer storage medium or computer databases can be used in a search to
XX      CC      identify open reading frames (ORFs) or coding sequences within the NMB
XX      CC      genome. The DNA sequences provide further opportunities to find antigenic
XX      CC      or immunogenic proteins which are more effective in vaccines than the
XX      CC      outer membrane proteins currently used

PT Detection of a trichloroethylene-decomposing microbe - using a medium
containing the chemical.
XX
PS Claim 1; Page 11; 17pp; Japanese.
XX
CC The present sequence represents a 16S rDNA of a trichloroethylene-
decomposing microbe, Burkholderia sp. N16-1 (FERM BP-5504). The invention
relates to a method for the detection of a trichloroethylene-decomposing
microbe, Burkholderia sp. N16-1 (FERM BP-5504) in which it is selectively
detected or counted by a medium containing the chemical by using the
CC chemical-resistant strain; it also provides a mutant of the
trichloroethylene-decomposing microbe, Burkholderia sp. N16-1 (FERM BP-
5504) having chemical resistance and maintaining trichloroethylene-
decomposing activity

PT region complementary to a targeted nucleic acid, and a capture
PT oligonucleotide.
XX
PS Claim 4; Page 175; 208pp; English.
XX
CC This invention relates to a novel method for isolating, depleting or
CC separating a targeted nucleic acid, such as rRNA, from a sample
CC comprising targeted and non-targeted nucleic acids. It effects a way of
CC enriching for non-targeted nucleic acids such as mRNAs. Isolating
CC sufficient quantities of high quality bacterial mRNA is a demanding
CC process which impedes analysis of bacterial gene expression in the
CC presence of host cells. A small percentage of bacterial mRNAs may be poly
CC -A tailed, but these are targeted for degradation and tend to be
CC unstable. As a result, the commonly employed method for mRNA purification
CC with eukaryotic cells, oligo-dT capture, is ineffective. The present
CC invention provides an alternative, more suitable method for mRNA
CC purification from prokaryotes. The method of the invention comprises the
CC purification of a sample with a bridging oligonucleotide (containing a
CC targeting region) and subsequently incubating with a capture
CC oligonucleotide allowing the isolation of the target from the sample. The
CC method is useful for depleting or isolating targeted nucleic acid, for
CC example rRNA such as prokaryotic 16S or prokaryotic 23S, eukaryotic 17S
CC or 18S or eukaryotic 28S rRNA, from a sample. The rRNA sequence may
CC comprise any one of 64 fully defined sequences as given in the
CC specification. The present sequence is that of a DNA sequence which
CC represents the sequence of 16S rRNA of Burkholderia pseudomallei related
CC to the invention.

PT Depleting or isolating targeted nucleic acids e.g. rRNA, involves using a
```

PT bridging oligonucleotide comprising bridging region and a targeting  
PT region complementary to a targeted nucleic acid, and a capture  
PT oligonucleotide.

PS Claim 4, Page 175-176; 208bp; English.

XX This invention relates to a novel method for isolating, depleting or  
CC separating a targeted nucleic acid, such as rRNA, from a sample  
CC comprising targeted and non-targeted nucleic acids. It effects a way of  
CC enriching for non-targeted nucleic acids such as mRNAs. Isolating  
CC sufficient quantities of high quality bacterial mRNA is a demanding  
CC process which impedes analysis of bacterial gene expression in the  
CC presence of host cells. A small percentage of bacterial mRNAs may be poly  
CC -A tailed, but these are targeted for degradation and tend to be  
CC unstable. As a result, the commonly employed method for mRNA purification  
CC with eukaryotic cells, oligo-dT capture, is ineffective. The present  
CC invention provides an alternative, more suitable method for mRNA  
CC purification from prokaryotes. The method of the invention comprises the  
CC incubation of a sample with a bridging oligonucleotide (containing a  
CC targeting region) and subsequently incubating with a capture  
CC oligonucleotide allowing the isolation of the target from the sample. The  
CC method is useful for depleting or isolating targeted nucleic acid, for  
CC example rRNA such as prokaryotic 16S or prokaryotic 23S, eukaryotic 17S  
CC or 18S or eukaryotic 28S rRNA, from a sample. The rRNA sequence may  
CC comprise any one of 64 fully defined sequences as given in the  
CC specification. The present sequence is that of a DNA sequence which  
CC represents the sequence of 16S rRNA of *Neisseria gonorrhoeae* related to  
CC the invention.

CC Novel bacterial strain ADP (ATCC 55464), isolated from atrazine-  
CC contaminated soil, is capable of degrading s-triazine cpds., including  
CC atrazine. In an attempt to identify the strain, the 16S ribosomal RNA  
CC sequence (AAT18760) was compared to that of *Escherichia coli* (AAT18759),  
CC Pseudomonas citrometabolis ATCC 13674 (AAT18761-63), Pseudomonas  
CC aeruginosa (AAT18764), Pseudomonas testosteroni (AAT18765) and  
CC Pseudomonas cepacia (AAT18766). It was concluded that ADP is closely  
CC related to, but distinct from, *P. citrometabolis* and *P. aeruginosa*.  
CC (Updated on 16-Oct-2003 to standardise OS field)

PT Production of terephthalic acid useful for the production of polyester  
involves bioconversion of p-xylylene comprises a single terephthalic acid  
producing microorganism.

XX Claim 4; Col 19-22; 21pp; English.

XX The present invention describes a method for the production of a  
CC terephthalic acid (TPA) comprising contacting an isolated TPA producing  
CC Proteobacteria with an aromatic organic substrate selected from p-xylylene,  
CC 4-methylbenzyl alcohol and para-tolualdehyde and recovering TPA. The  
CC method can be used for the production of polyesters which are required  
CC for fibers, films, paints, adhesives and beverage containers. The process  
CC is environmentally friendly, safe, economical and produces compounds of  
CC commercial interest. The method has broad applicability for production of  
CC terephthalic acid and isophthalic acid. The present sequence represents  
CC the specifically claimed 16S rRNA nucleotide sequence from the  
CC Burkholderia sp. TPA producing microorganism

XX Terephthalic acid producing proteobacteria isolated by culturing sample  
PT suspected of containing the bacteria in medium having aromatic organic  
PT substrate, adding xylene and isolating bacteria producing terephthalic  
PT acid.

PS Claim 4; Col 19-20; 21pp; English.

XX The invention describes a pure isolate of a terephthalic acid (TA)  
CC producing proteobacteria, comprising genes encoding all enzymes of the TA  
CC biosynthetic pathway. The proteobacteria are useful for producing TA and  
CC isophthalic acid, and various intermediates in the synthesis of TA such  
CC as 4-carboxybenzyl alcohol and 4-carboxybenzaldehyde. The TA and  
CC isophthalic acid have utility in the production of polyesters needed in  
CC fibres, films, paints, adhesives and beverage containers. This sequence  
CC represents the Burkholderia sp 16S ribosomal RNA gene amplification of  
CC which was used to identify Burkholderia and Pseudomonas isolates

PT	New terephthalic acid-producing microorganism e.g. for producing		
PT	terephthalic acid for production of polyesters commercially required in		
PT	large quantities for fibers, films, paints, adhesives and beverage		
PT	containers.		
XX			
PS	Claim 6; SEQ ID NO 1; 24pp; English.		
XX			
XX			
CC	The invention relates to a terephthalic acid (TPA) producing		
CC	microorganism isolated by a process comprising culturing a sample		
CC	suspected of containing a TPA producing microorganism in a suitable		
CC	growth medium containing at least one aromatic organic substrate selected		
CC	from p-xylene, p-toluic acid and TPA, selecting those microorganisms that		
CC	are able to use every substrate selected individually from p-xylene, p-		
CC	toluic acid and TPA as a sole carbon source, contacting the		
CC	microorganisms selected in the above step with p-xylene to form a		
CC	reaction medium and monitoring the reaction medium over time for the		
CC	presence of TPA, where the production of TPA indicates the presence of a		
CC	TPA producing microorganism. The invention also relates to a method of		
CC	producing isophthalic acid (IPA) by contacting an isolated TPA producing		
CC	microorganism with an aromatic organic substrate and at least one		
CC	suitable induction compound, where isophthalic acid accumulates, and		
CC	optionally recovering the isophthalic acid. The microorganism is useful		
CC	for producing terephthalic acid for the production of polyesters that are		
CC	commercially required in large quantities for fibres, films, paints,		
CC	adhesives and beverage containers. The isophthalic acid is useful in		

CC	condensation reactions with diamines to form polyamides. This sequence
CC	represents the 16S rRNA gene of the TPA producing microorganism
CC	Burkholderia isolate IR3.

 DR Biodegradation of chlorinated aliphatic compounds - with Gram-negative  
 PT aerobic filamentous bacterium.  
 XX Claim 3; Col 23-26; 35pp; English.  
 PS The present sequence represents the 16S ribosomal DNA from an unknown  
 CC (possible new species) gram-negative aerobic filamentous bacterium,  
 CC designated strain A-1. The present invention also describes: (1) a

CC bioremediation method comprising contacting an environmental sample  
 CC contaminated with chlorinated aliphatic compounds (CACs) with a CAC-  
 CC metabolising aerobic Gram-negative bacterium which: (a) has non-sheathed  
 CC rod-shaped cells that are filamentous in appearance and have a length of  
 CC 20-200 micro m; (b) accumulates poly-beta-hydroxybutyrate in  
 CC intracellular granules under nitrogen-limiting conditions; (c) is capable  
 CC of growing in the presence of 0.2% phenol or 1% saturated toluene vapour;  
 CC and (d) does not grow in carbohydrates; (2) a bioremediation method  
 CC comprising selecting a soil or water sample contaminated with CACs,  
 CC contacting the sample with a stream of air into which the CACs are  
 CC transferred, and contacting the CAC-bearing air with a bacterium as  
 CC above. The methods are to degrade CACs such as trichloroethylene (TCE)  
 CC and dichloroethylene (DCE) in soil, water or air. The bacterium is more  
 CC suitable for bioremediation than methanotrophic bacteria due to its  
 CC ability to tolerate CAC metabolites, its tolerance for relatively high  
 CC concentrations of substrate and its having a higher rate of endogenous  
 CC CAC conversion, and can tolerate higher TCE concentrations than other  
 CC phenol-degrading microorganisms

 PT bioreactor.  
 PS  
 XX  
 Claim 1; SEQ ID NO 4; 24bp; English.  
 CC  
 CC An isolated 16S rdna sequence (1) indicative of the presence of an  
 CC activated bacterial strain comprises: any of 7 fully defined sequences of  
 CC 1385-1539 bp (SEQ ID NO:1-7) or any of 15 fully defined sequences of 18-  
 CC 46 bp (SEQ ID NO:16-30), all given in the specification; hybridizing  
 CC with the sequence of (a) under conditions of 6x times; SSC (1 M NaCl), 50°  
 CC formamide, 1% SDS at 37degC, and a wash in 0.1x times; SSC at 60-65degC  
 CC ; at least 97% sequence identity to the sequence of (a); or complements  
 CC of the sequences of (a), (b) or (c). INDEPENDENT CLAIMS are also included  
 CC for the following: a method for identifying an activated sludge bacterial  
 CC strain, comprising extracting genomic DNA from a bacterial cell, and  
 CC probing the DNA with a probe derived from any of the sequences of (1) or  
 CC under suitable hybridization conditions, where the identification of a  
 CC hybridizable nucleic acid fragment confirms the presence of an activated  
 CC sludge bacterial strain, or amplifying the extracted DNA with at least  
 CC one oligonucleotide primer corresponding to a portion of any of the  
 CC sequences of (1) such that amplification products are generated, where  
 CC the presence of the amplification products confirms the presence of  
 CC activated sludge bacterial strain; a pyruvate degrading bacterial strain  
 CC having the 16S rdna sequence from SEQ ID NO: 1, 2, 5, 6 and 7; a acetate  
 CC degrading bacterial strain having the 16S rdna sequence from SEQ ID NO: 3  
 CC and 4; a benzoate degrading bacterial strain having the 16S rdna sequence  
 CC from SEQ ID NO: 2, 6 and 7; a denitrifying degrading bacterial strain  
 CC having the 16S rdna sequence from SEQ ID NO: 1 and 6; a method for the  
 CC degradation of pyruvate, acetate or benzoate, comprising contacting the  
 CC bacterial strain of (2)-(4) under suitable growth conditions with a  
 CC pyruvate, acetate or benzoate whereby the pyruvate, acetate or benzoate  
 CC is degraded, respectively; and a method for the reduction of nitrate,  
 CC comprising contacting the bacterial strain of (5) under suitable  
 CC conditions with a nitrate whereby the nitrate is reduced. Also disclosed  
 CC are polypeptides, vectors, host cells, primers, probes and a variety of  
 CC isolated strains used in the present invention. Preferred Method: The  
 CC bacterial cell in any of the methods cited above is contained within  
 CC wastewater sludge, and/or is contained within an environmental sample  
 CC selected from groundwater and soil. The methods and compositions of the  
 CC present invention are useful for molecular biology and microbiology,  
 CC particularly in identifying and isolating several previously unrecognized  
 CC bacteria from an industrial wastewater bioreactor. The isolation of  
 CC several strains of bacteria from a wastewater bioreactor was investigated  
 CC using several types of standard microbiological agar media. The 16S rdna  
 CC sequences of the bacterial strains were no more than 95% identical to the  
 CC 16S rdna sequences amplified and sequenced by standard PCR. 16S rdna  
 CC sequences that have less than 97% identity were most likely derived from  
 CC different bacterial species. Since the 16S rdna sequences derived from  
 CC EMB19A and NBY13 have less than 96% identity with the most similar 16S  
 CC sequences already present in the Genbank, the 16S rdna sequences from  
 CC EMB19A and NBY13 are significantly different from any other 16S rdna or  
 CC rdna sequence previously known to art.

XX New isolated 16S rDNA sequence indicative of the presence of an activated  
PT sludge bacterial strain, useful for rapidly identifying and monitoring  
PT bacterial strains in samples taken from a wastewater bioreactor.

PS Claim 1; SEQ ID NO 4; 25pp; English.  
CC The invention relates to an isolated 16S rDNA sequence. The isolated 16S  
CC rDNA sequence is indicative of the presence of an activated sludge  
CC bacterial strain. The invention also relates to methods for identifying  
CC an activated sludge bacterial strain, a pyruvate degrading bacterial  
CC strain, an acetate degrading bacterial strain, a benzoate degrading  
CC bacterial strain, methods for degrading pyruvate, acetate or benzoate and  
CC a method for reducing nitrate. Identifying an activated sludge bacterial  
CC strain comprises extracting genomic DNA from a bacterial cell and probing  
CC the extracted genomic DNA with a probe derived from any of the above-  
CC mentioned sequences under suitable hybridization conditions, where the  
CC identification of a hybridizable nucleic acid fragment confirms the  
CC presence of an activated sludge bacterial strain. Alternatively, the  
CC method comprises extracting genomic DNA from a bacterial cell and  
CC amplifying the extracted genomic DNA with at least one oligonucleotide  
CC primer corresponding to a portion of the above-mentioned sequences, such  
CC that amplification products are generated, where the presence of  
CC amplification products confirms the presence of an activated sludge  
CC bacterial strain. The bacterial cell is contained within wastewater  
CC sludge or within an environmental sample selected from groundwater and  
CC soil. Degrading pyruvate, acetate or benzoate comprises contacting the  
CC bacterial strain under suitable growth conditions with an amount of  
CC pyruvate, acetate or benzoate. Reducing nitrate comprises contacting the  
CC bacterial strain under suitable growth conditions with an amount of  
CC nitrate. The 16S rDNA sequences and methods are useful in rapidly  
CC identifying and monitoring the corresponding bacterial strains in samples  
CC taken from a wastewater bioreactor or from any environment which might  
CC contain the specified bacteria. This sequence represents an isolated 16S  
CC rDNA of the invention.

BH656222/c 1031 bp DNA linear GSS 19-FEB-2002

LOCUS BOMZ86TF BO.2\_3\_KB Brassica oleracea genomic clone BOMZ86, 1031 bp

DEFINITION genomic survey sequence.

ACCESSION BH656222

VERSION BH656222.1 GI:18714532

KEYWORDS GSS.

SOURCE Brassica oleracea

ORGANISM Brassica oleracea

Eukaryota; Viridiplantae; Streptophyta; Embryophyta; Tracheophyta; Spermatophyta; Magnoliophyta; eudicotyledons; core eudicotyledons; rosids; eurosids II; Brassicales; Brassicaceae; Brassica.

REFERENCE 1 (bases 1 to 1031)

Ayale, M., Haas, B.J., Kumar, N., Wu, H., Xiao, Y., Van Aken, S., Utecher, T.R., Wortman, J.R., White, O.R. and Town, C.D.

Whole genome shotgun sequencing of Brassica oleracea and its application to gene discovery and annotation in Arabidopsis

Genome Res. 15 (4), 487-495 (2005)

15805490

RNA prepared and library constructed by W. Walter Lorenz (School of  
Forest Resources, University of Georgia); plant material prepared  
by Craig Zimmermann (School of Forest Resources, University of  
Georgia) using rooted cuttings provided by the Forest Biology  
Research Cooperative (FBRC) and the CCLONES project at the  
University of Florida; sequencing done in the Laboratory for  
Genomics and Bioinformatics, University of Georgia. Sequence ends  
have been trimmed to exclude vector and regions below Phred quality  
16. Three-prime sequences are presented as their reverse complement  
and have been trimmed to exclude polyA.  
Seq primer: JENREV (CAGGAACGCTATGACC).

/note="Organ: root; Vector: pSL180; Site 1: EcoRI;  
Site 2: XhoI. The library was prepared from polyA+ RNA  
from the roots of 1-year-old loblolly pine (Pinus taeda)  
cuttings that were rooted and then planted in washed sand.  
Prior to harvesting tissues for RNA isolation, the rooted  
cuttings were maintained for 27 days (April 2003) under  
ambient conditions in a local greenhouse. They were kept  
on a weekly regimen of 0.5x nutrient-complete Hoagland's  
solution and supplemented with additional water sufficient  
to maintain 5% soil moisture content. Pots holding the  
rooted cuttings were fully submerged in water for 24 hours  
prior to harvest of the roots for RNA isolation.  
Double-stranded cDNA was cloned unidirectionally into  
pSL180. Inserts can be excised with EcoRI (5' end) and  
XhoI (3' end)."

## FEATURES

source

1..745  
 /organism="Chlamydomonas reinhardtii"  
 /mol\_type="mRNA"  
 /strain="CC-1690 wild type mt+ 21gr"  
 /db\_xref="taxon:3055"  
 /clone\_1lb="C. reinhardtii CC-1690 (mt+), Stress III  
 (normalized), lambda zap II"  
 /note="Vector: pBluescript II SK-; Site\_1: EcoRI, Site\_2:  
 XhoI; Stress condition III library, constructed by  
 Jeanette Quinn and Chung-wen Chang, combined cDNAs from  
 CC-1690 cells grown to mid-log phase in copper-free TAP  
 medium (see Quinn and Merchant (1998) Methods in  
 Enzymology, 299:263-279) in a shaking (250 rpm) illuminated  
 (about 100 micromole/m2/sec) incubator at 22 C (see Quinn  
 and Merchant (1998) Methods in Enzymology, 299:263-279);  
 CC-1690 cells grown to mid-log phase in low Fe (1  
 micromolar Fe) TAP medium (see La Fontaine S, Quinn JM,  
 Nakamoto SS, Page MD, Gohre V, Moseley JL, Kropat J,  
 Merchant S, LaFontaine et al. (2002) Eukaryotic Cell,  
 1:736-757) in a shaking illuminated incubator (same  
 conditions as above). CC-1690 cells were grown to mid-log  
 phase in TAP medium in a shaking illuminated incubator to  
 a density of 8x10<sup>6</sup> cells/ml. The flask was transferred to  
 a shaking platform (200 rpm) at room temperature (23C) 12  
 micromole/m2/sec illumination and bubbled in a scopered  
 flask with 98% nitrogen, 2% CO<sub>2</sub> gas mixture for 1 hour  
 prior to harvesting for RNA isolation (as per Quinn JM,  
 Barraco P, Eriksson M, Merchant S, Quinn et al. (2000) JBC  
 275:6080-6089); CC-1690 cells grown to mid-log phase  
 (3x10<sup>6</sup> cells/ml) in TAP medium in a shaking (150 rpm)  
 illuminated (70 mole photon/m2/sec) incubator at 27 C.  
 Cells were diluted to 1x10<sup>6</sup> cells/ml, transferred to high  
 light (11000 mol photon/m2/s) with shaking (150 rpm) and  
 sampled at (0.5, 1.2, 4, 6, 12 hrs); PolyA mRNA was purified  
 from each sample, pooled and cDNA synthesized (see Strager  
 et al. Plant Physiol. 131, 401-408 for details). The cDNA  
 was directionally cloned into lambda zap II (Stratagene)  
 in the EcoRI (5') and XhoI (3') sites. pBluescript II SK-  
 plasmids were excised from the lambda Zap clones by  
 superinfection with Exsist (Stratagene) phage. The  
 library was normalized using method 4 described in Bonaldo  
 et al., (1996) Genome Research 6: 791-806."

 FEATURES  
 source  
 Location/Qualifiers  
 1..770  
 /organism="Chlamydomonas reinhardtii"  
 /mol\_type="mRNA"  
 /strain="CC-1690 wild type mt+ 21gr"  
 /db\_xref="taxon:3055"  
 /clone\_id="C. reinhardtii CC-1690 (mt+), Stress III  
 (normalized), Lambda Zap II"  
 /note="Vector: pBluescript II SK-. Site 1: EcoRI; Site 2:  
 XhoI; Stress condition III library, combines cDNAs from  
 Jeanette Quinn and Chung-Wen Chang, combines cDNAs from  
 CC-1690 cells grown to mid-log phase in copper-free TAP  
 medium (see Quinn and Merchant (1998) Methods in  
 Enzymology, 2997:263-279) in a shaking (250 rpm) illuminated  
 (about 100 micromole/m2/sec) incubator at 22 C (see Quinn  
 and Merchant (1998) Methods in Enzymology, 2997:263-279);  
 CC-1690 cells grown to mid-log phase in low Fe (1  
 micromolar Fe) TAP medium (see La Fontaine S, Quinn JM,  
 Nakamoto SS, Page MD, Gohre V, Moseley JL, Kropat J,  
 Merchant S, LaFontaine et al. (2002) Eukaryotic Cell,  
 1:736-757) in a shaking illuminated incubator (same  
 conditions as above). CC-1690 cells were grown to mid-log  
 phase in TAP medium in a shaking illuminated incubator to  
 a density of 8x10<sup>6</sup> cells/ml. The flask was transferred to  
 a shaking platform (200 rpm) at room temperature (23C) 12  
 micromole/m2/sec illumination and bubbled in a stoppered  
 flask with 98% nitrogen. 2% CO<sub>2</sub> gas mixture for 1 hour  
 prior to harvesting for RNA isolation (as per Quinn JM,  
 Barraco P, Eriksson M, Merchant S, Quinn et al. (2000) JBC  
 275:6080-6089); CC-1690 cells grown to mid-log phase  
 (3x10<sup>6</sup> cells/ml) in TAP medium in a shaking (150 rpm)  
 illuminated (70 mole photon/m2/sec) incubator at 27 C.  
 Cells were diluted to 1x10<sup>6</sup> cells/ml, transferred to high  
 light (11000 mol photon/m2/s) with shaking (150 rpm) and  
 sampled at (0.5, 1, 2, 4, 6, 12 hrs); CC-1690 cells grown to  
 mid-log phase in HS medium in a shaking (150 rpm)  
 illuminated (70 mole photon/m2/sec) incubator at 27 C.  
 Cells were diluted to 1x10<sup>6</sup> cells/ml, transferred to high  
 light (11000 mol photon/m2/s) with shaking (150 rpm) and  
 sampled at (0.5, 1, 2, 4, 6, 12 hrs). Poly A mRNA was purified  
 from each sample, pooled and cDNA synthesized (see Strager  
 et al, Plant Physiol. 131, 401-408 for details). The cDNA  
 was directionally cloned into lambda Zap II (Stratagene)  
 in the EcoRI (5') and XhoI (3') sites. pBluescript II SK-  
 plasmids were excised from the lambda Zap clones by  
 superinfection with Exsist (Stratagene) phage. The  
 library was normalized using method 4 described in Bonaldo  
 et al., (1996) Genome Research 6: 791-806."
